# Apex Exam Guidebook

## Biology

### Year 12 QCE

**Resource Hub Link:** <https://www.apexbooks.com.au/>

- Subscribe for future updates.
- Contact details for any queries or feedback.
- Relevant QCE subject information.
- University scholarship information.
- Other useful information.

#### Key Features of the Apex Exam Guidebooks

- Contains recent QCE exam questions from 2024 to 2020, categorised based on the most up to date QCAA syllabus reviews.
- Significantly reduced overall cost compared to alternative book options.
- Future editions will be released with the most up to date QCE exams.
- Students can review chapters, specific questions or solutions at any given time throughout the course.
- Students can refer to relevant chapters to complete during class or for private study to prepare for topic tests or exams.
- Teachers can use these eBooks as a great reference point for lesson planning, developing internal assessments or when preparing class activities to ensure alignment with exam level questions.
- Mark allocation included to guide student time management.
- Fully worked answers from the QCE marking guide are included for feedback.
- Increase student confidence and enable high achievement.

#### How to Use Apex Exam Guidebooks

Purchase of these eBook PDFs allows your students access to previous QCE exam questions, arranged by syllabus topics and answers from the marking guide. Revision for QCE assessments or exams becomes much more straightforward. Students can review chapters, specific questions or solutions at any given time throughout the course. Students can be referred to relevant chapters to complete during class or privately to prepare for topic tests or exams. These textbooks also act as a great reference for teachers regarding lesson planning, developing internal assessments or when preparing class activities to ensure alignment with exam level questions.

## Unit 3 – Biodiversity and the interconnectedness of life

### Unit 3 - Topic 1: Describing biodiversity

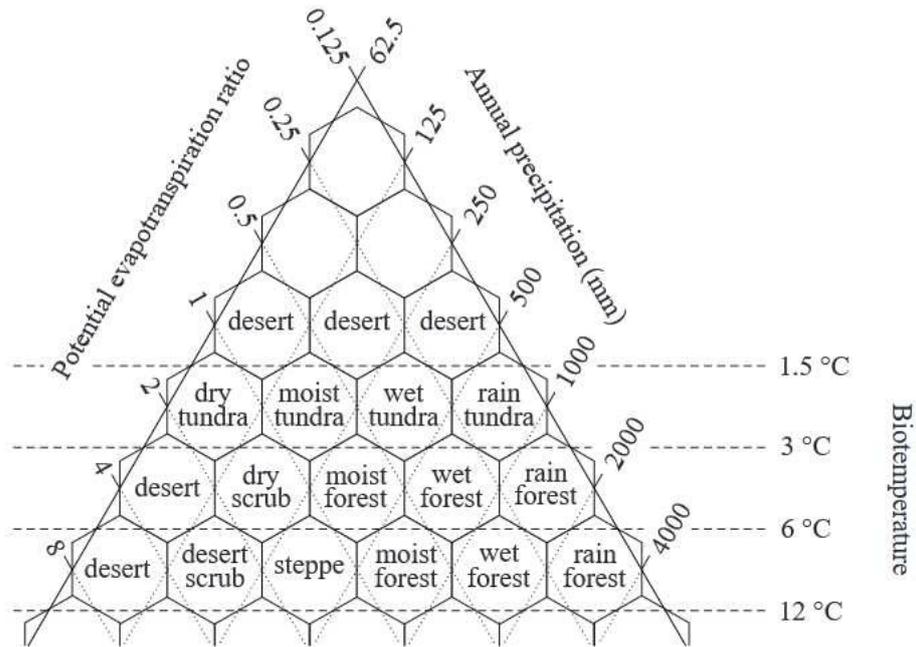

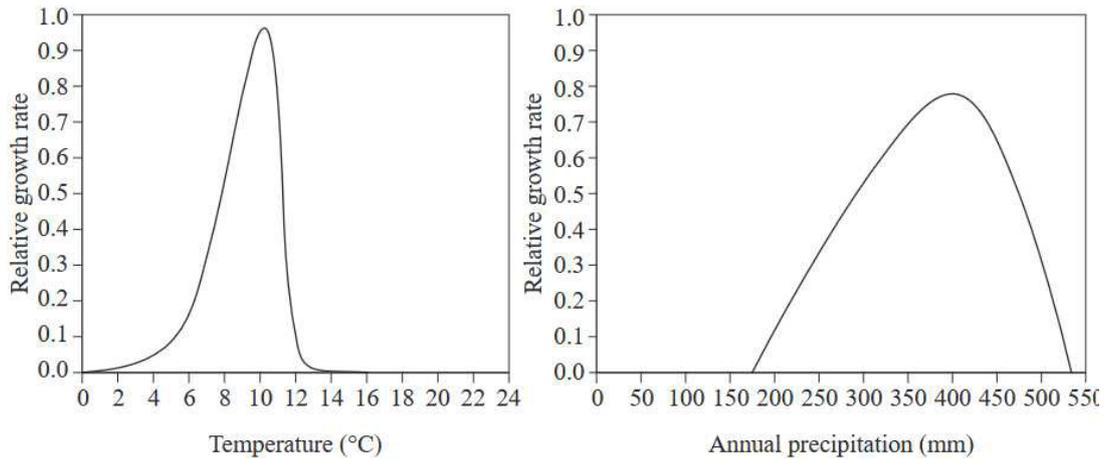

#### Paper 1 Section 1

<b>2024 Paper 1 Section 1 Question 1  Describing biodiversity</b>	Which term describes a group of organisms consisting of a common ancestor and all its lineal descendants?  (A) clade (B) subgroup (C) population (D) community
---	---

<b>2024 Paper 1 Section 1 Question 5  Describing biodiversity</b>	A limitation of the biological species concept is that it does not account for species that  (A) reproduce asexually. (B) are reproductively isolated. (C) are morphologically indistinguishable. (D) have a different number of chromosomes
---	---

2024  
Paper 1  
Section 1  
Question 7  
  
Describing  
biodiversity

Tolerance ranges for species X and a Holdridge life zone classification chart are shown.

Based on this data, the preferred habitat for species X is

- (A) desert.
- (B) steppe.
- (C) wet tundra.
- (D) moist forest.

2024  
Paper 1  
Section 1  
Question 8  
  
Describing  
biodiversity

In the Linnaean system of classification, two species of the same class will also belong to the same

- (A) order.
- (B) genus.
- (C) family.
- (D) phylum.

2023  
Paper 1  
Section 1  
Question 1  
  
Describing  
biodiversity

The biological species concept defines species as a group of organisms

- (A) with a common set of alleles.
- (B) descended from a common ancestor.
- (C) occupying the same niche or adaptive zone.
- (D) that can interbreed to produce fertile offspring.

<p><b>2023</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 2</b></p> <p><b>Describing biodiversity</b></p>	<p>Species classified as K-strategists</p> <p>(A) often live in unstable habitats. (B) exhibit an exponential rate of reproduction. (C) reach sexual maturity later than r-strategists. (D) are first to colonise a new environment created by a disturbance.</p>

**2021  
Paper 1  
Section 1  
Question 9**

**Describing  
biodiversity**

The image represents a gridded quadrat of 20 cm×20 cm squares used in a plant survey. To calculate cover for a species, the surveyor identified each plant species and then counted the number of squares in which the species appeared.

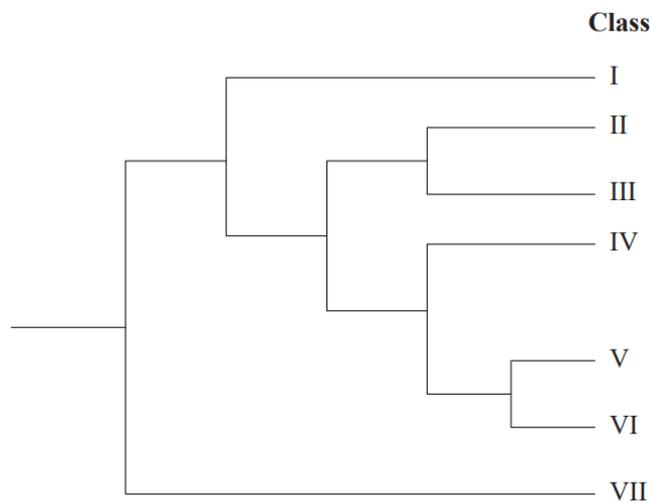

What is the approximate percentage cover of Species A?

- (A) 22%
- (B) 44%
- (C) 53%
- (D) 58%

**2021  
Paper 1  
Section 1  
Question 17**

**Describing  
biodiversity**

This is a cladogram for seven different classes of organisms (I–VII).

Which two classes of organisms are most closely related?

- (A) I and VII
- (B) IV and VI
- (C) I and II
- (D) III and IV

<b>2020</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 11</b>  <b>Describing biodiversity</b>	The Linnaean system originally used which type of evidence for classifying organisms? (A) physical features (B) common ancestry (C) molecular phylogeny (D) reproduction methods
---	--

<b>2020</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 14</b>  <b>Describing biodiversity</b>	One of the common assumptions in cladistics is that (A) not all organisms are related by descent. (B) the characteristics of organisms in a population stay the same over time. (C) new kinds of organisms may arise when existing populations divide into two groups. (D) the more shared characteristics two organisms have, the more closely related they are.
---	---

<b>2020</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 16</b>  <b>Describing biodiversity</b>	<p>The figures show the original distribution zone of Species I and some possible distribution zones of Species I after the introduction of Species II.</p> <div style="text-align: center;"> </div> <p>Species II has a competitive advantage over Species I; however, it does not tolerate areas of lower rainfall.</p> <p>Which of the following would be an accurate prediction of the new distribution zone for Species I?</p> <p>(A) Zone A, i.e. no change to the distribution          (B) Zone B, i.e. reduced distribution within the original zone          (C) Zone C, i.e. new distribution outside the original zone          (D) Zone D, i.e. complete removal of the species from the ecosystem</p>
---	---

**2023  
Paper 1  
Section 2  
Question 25**

**Describing  
biodiversity**

The effect of an invasive species on plant biodiversity was investigated by collecting this data from an ecosystem.

		Percentage cover (invasive species)				
		0–20%	>20–40%	>40–60%	>60–80%	>80–100%
Plant biodiversity	Species richness	7	7	7	4	2
	Simpson’s diversity index	0.83	0.77	0.55	0.49	0.30

a) Contrast species richness in areas of low invasive species cover (0-20%) with areas of high invasive species cover (>80-100%).

---

---

---

b) Draw a conclusion about the effect of the invasive species on plant biodiversity in this ecosystem. Justify your response. [2 marks]

---

---

---

---

c) Explain why having data on species richness and Simpson’s diversity index having is more informative than a single measure for the purpose of this investigation. Refer to the table to support your response. [3 marks]

**2021  
Paper 1  
Section 2  
Question 23**

**Describing biodiversity**

To determine the species diversity and species richness of a wetland ecosystem, ecologists surveyed communities adjacent to a river, using two methods for each community:

1. random species sampling with predetermined grid numbers, with 10 quadrats of 4 m<sup>2</sup> each used for these grids.
2. three belt transect lines (50 m×2 m) across predetermined sampling locations based on strata variation.

The map shows the locations of quadrats and transect lines. The table shows survey results.

Not to scale

	Survey method	
	Quadrat	Belt transect
Species diversity (Simpson's diversity index)	0.6	0.8
Species richness (number of species)	16	22

a) Identify three differences between the survey methods used to determine species diversity and species richness in the ecosystem. [3 marks]

---

---

---

---

---

---

---

---

b) Draw a conclusion about the most suitable method for estimating species diversity and species richness of the communities in this wetland ecosystem. Give a reason to support your conclusion. [2 marks]

---

---

**2020**  
**Paper 1**  
**Section 2**  
**Question 21**  
  
**Describing**  
**biodiversity**

A count was conducted to determine the number of individuals for five different bird species in a woodland.

Calculate the relative percentage abundance of species B. Show your working. [2 marks]

---

---

---

---

---

---

**2020**  
**Paper 1**  
**Section 2**  
**Question 22**  
  
**Describing**  
**biodiversity**

The following cladogram proposes the evolutionary history of several fish phyla (A–H).

a) Define the term clade. Circle an example of a clade on the cladogram. [2 marks]

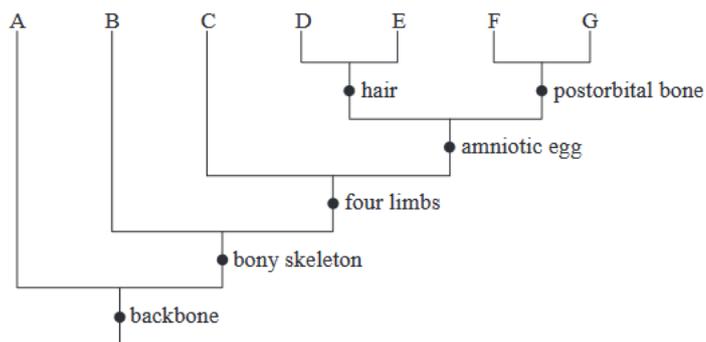

Note: If you make a mistake on the cladogram, cancel it by ruling a single diagonal line through your work and use the additional cladogram on page 13 of this question and response book.

b) Which node (1–7) represents the most recent common ancestor for species E and G? [1 mark]

c) Which two species shared the most recent common ancestor? [1 mark]

2024  
Paper 2  
Section 1  
Question 1  
  
Describing  
biodiversity

This cladogram shows the development of key features in species A to G.

a) Identify the most distant relative of species C. [1 mark]

b) List all the features you would expect to observe in the most recent common ancestor of species C and F. [1 mark]

c) Identify the features that could be used to distinguish between species C and D. [1 mark]

**2024  
Paper 2  
Section 1  
Question 8**  
  
**Describing  
biodiversity**

The table shows data from a transect study along a sand dune.

	Zone			
	A	B	C	D
<b>Distance from sea (m)</b>	0–100	>100–150	>150–250	>250–300
<b>Age of dune (years)</b>	0–50	>50–100	>100–125	>125–150
<b>pH of soil</b>	8.4	7.4	6.9	6.0
<b>Organic matter in soil (%)</b>	1	2.5	5	30
<b>Number of grass species</b>	2	4	6	2
<b>Number of tree species</b>	0	1	3	8

a) Contrast species richness in zones A and D. Refer to data in your response. [2 marks]

---

---

---

b) Infer how organic matter affects the pH of soil. Justify your response. [2 marks]

---

---

---

c) Predict which zone would have the highest proportion of K-selected species.  
Explain your reasoning. [2 marks]

---

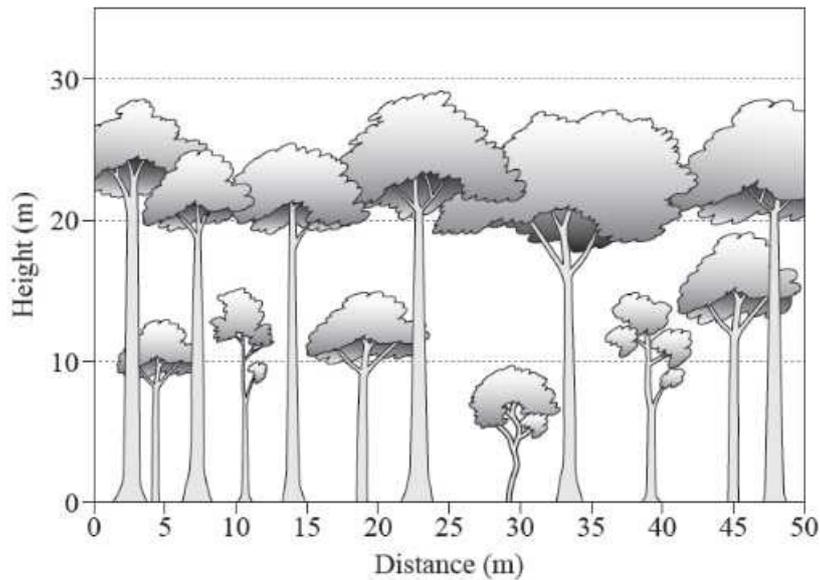

---

---

---

---

The profile diagram shows a representative section of an ecosystem.

This table can be used to classify ecosystems based on Specht’s classification system.

Life form and height of tallest stratum	Foliage cover of tallest plant layer		
	Dense (70–100%)	Mid-dense (30–70%)	Sparse (10–30%)
Trees >30 m	Tall closed-forest	Tall open-forest	Tall woodland
Trees 10–30 m	Closed-forest	Open-forest	Woodland
Trees 5–10 m	Low closed-forest	Low open-forest	Low woodland
Shrubs 2–8 m	Closed-scrub	Open-scrub	Tall shrubland

a) Classify this ecosystem. [1 mark]

b) Describe how field data could be collected for the purpose of classifying this ecosystem using Specht’s classification system. Include at least one strategy to minimise bias. [3 marks]

---

---

---

---

---

---

---

---

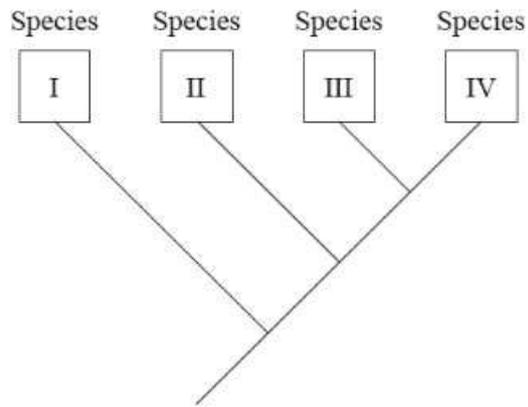

---

---

b) Use the data to infer species II-IV in the cladogram. [1 mark]

I: *B. bartonus*

II:

III:

IV:

**2022  
Paper 2  
Section 1  
Question 9**

**Describing  
biodiversity**

The biological species concept defines species as a group of organisms that can interbreed to produce fertile offspring.

a) Identify another method for defining a species. [1 mark]

b) Describe one limitation of the biological species concept and one limitation of the method identified in Question 9a). [2 marks]

**2021  
Paper 2  
Section 1  
Question 6**

**Describing biodiversity**

The term *species* could be defined as ‘one group of individuals that actually or potentially interbreed in nature’.

Identify two limitations of this definition. [2 marks]

---

---

---

---

---

---

**2021  
Paper 2  
Section 1  
Question 12**

**Describing biodiversity**

An investigation compared mangrove species diversity for two areas of different size in the same catchment. The table shows species population counts for each area.

		Area 1	Area 2
<b>Total species count</b>	Grey mangrove	37	7
	Red mangrove	32	3
	Yellow mangrove	25	88
<b>SDI</b>		0.67	?

a) Calculate Simpson’s diversity index for Area 2. Show your working. [2 marks]

$$SDI = 1 - \left( \frac{\sum n(n-1)}{N(N-1)} \right)$$

---

---

---

---

SDI = \_\_\_\_\_ (correct to two decimal places)

	b) Using your answer for Question 12a), compare the diversity of the two areas. [3 marks]

<b>2020 Paper 2 Section 1 Question 1</b>  <b>Describing biodiversity</b>	a) Explain how a species interaction may be classified as symbiotic. [2 marks]
	b) Using an example, describe the symbiotic relationship of mutualism. [2 marks]

**2020  
Paper 2  
Section 1  
Question 4**

**Describing  
biodiversity**

An ecologist investigated the species composition of mangrove trees in a natural mangrove forest and an adjacent 30-year-old planted mangrove forest.

Three 10 m-wide belt transects were sampled from inland to the sea for each of the forests, each covering 100 m on average and placed to cover various strata.

The species diversity of Forest A was determined using the Simpson’s Diversity Index (SDI):

$$SDI = 1 - \left( \frac{\sum n(n-1)}{N(N-1)} \right)$$

Species	Population count	
	Forest A (natural)	Forest B (planted)
Grey mangrove	91	77
Red mangrove	23	14
River mangrove	11	8
Orange mangrove	3	0
<b>Diversity</b>	0.46	?

a) Use the SDI formula to calculate the diversity index for Forest B. Round your answer to two decimal places. [2 marks]

---

---

---

---

---

---

b) Identify three reasons why the ecologist used a belt transect rather than line transects or randomly placed quadrats for collecting data to compare these two forests. [3 marks]

---

---

---

---

---

---

c) Identify one way in which the ecologist minimised bias in the sampling. [1 mark]

---

---

**2020  
Paper 2  
Section 1  
Question 7**

**Describing  
biodiversity**

Species richness (S) can be determined using the Menhinick's Index, where s is the number of different species represented in a sample and N is the total number of individual organisms in the sample.

$$\text{Species richness (S)} = \frac{s}{\sqrt{N}}$$

Sampling of two communities (Community A and Community B) were completed, with Community A having S = 0.5 for the six species identified. The results for Community B are shown in the table.

Community B	
Species	Number of individuals
A	12
B	15
C	19
D	22
E	25
F	7

Use S to compare Community A with Community B. [4 marks]

---

---

---

---

---

---

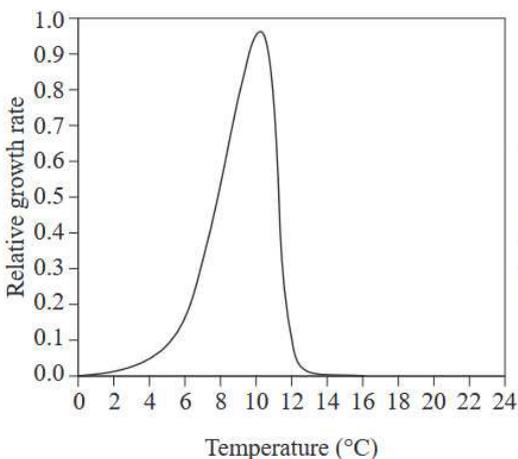

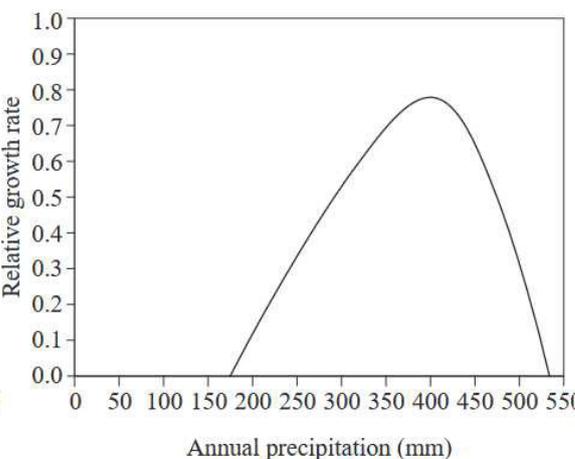

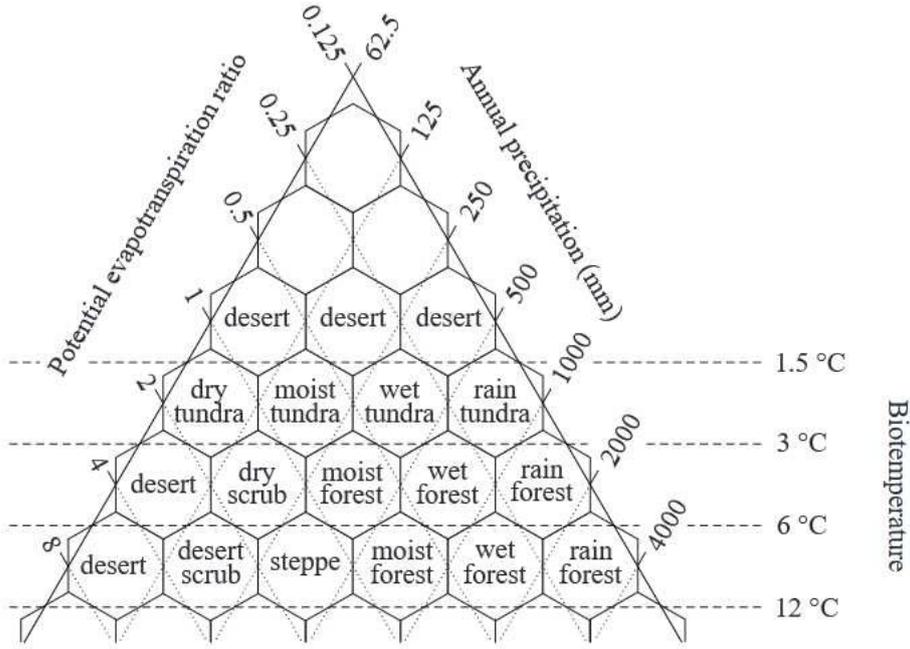

---

---

Paper 1  
Section 1  
Question 3

Describing  
biodiversity

A survey of grasshopper species was conducted across four eucalypt communities. Counts were conducted and the average abundance per 400 m<sup>2</sup> recorded.

Community	Grasshopper species (A–F)						Total
	A	B	C	D	E	F	
I	32	18	1	3	0	46	100
II	3	2	0	1	3	12	21
III	3	2	28	3	18	51	105
IV	18	13	12	14	16	15	88

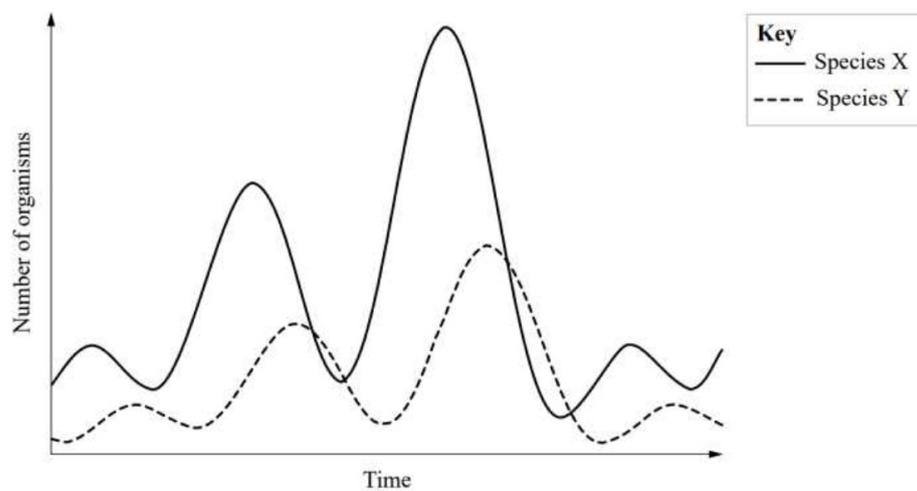

Which community has both the highest species richness and highest evenness for grasshoppers?

- (A) I
- (B) II
- (C) III
- (D) IV – Answer**

Marking Guide – Paper 1 Section 2

<p><b>2024</b> <b>Paper 1</b> <b>Section 2</b> <b>Question 21</b></p> <p><b>Describing biodiversity</b></p>	<p>In 2014, a group of scientists surveyed a plant community and determined Simpson’s diversity index (SDI) to be 0.84. They returned to the same site in 2024 and collected this data.</p>								
	<table border="1"> <thead> <tr> <th>Species</th> <th>Number of individuals</th> </tr> </thead> <tbody> <tr> <td>A</td> <td>133</td> </tr> <tr> <td>B</td> <td>96</td> </tr> <tr> <td>C</td> <td>256</td> </tr> </tbody> </table>	Species	Number of individuals	A	133	B	96	C	256
	Species	Number of individuals							
	A	133							
B	96								
C	256								
<p>a) Calculate SDI in 2024 using the formula <math>SDI = 1 - \left( \frac{\sum n(n-1)}{N(N-1)} \right)</math>. Show your working. [2 marks]</p>									
<table border="1"> <thead> <tr> <th>Sample response</th> <th>The response</th> </tr> </thead> <tbody> <tr> <td> <math display="block">SDI = 1 - \left( \frac{(133 \times 132) + (96 \times 95) + (256 \times 255)}{485 \times 484} \right)</math> <math display="block">= 0.61</math> </td> <td> <ul style="list-style-type: none"> <li>determines SDI as 0.61 [1 mark]</li> <li>provides appropriate working [1 mark]</li> </ul> </td> </tr> </tbody> </table>	Sample response	The response	$SDI = 1 - \left( \frac{(133 \times 132) + (96 \times 95) + (256 \times 255)}{485 \times 484} \right)$ $= 0.61$	<ul style="list-style-type: none"> <li>determines SDI as 0.61 [1 mark]</li> <li>provides appropriate working [1 mark]</li> </ul>					
Sample response	The response								
$SDI = 1 - \left( \frac{(133 \times 132) + (96 \times 95) + (256 \times 255)}{485 \times 484} \right)$ $= 0.61$	<ul style="list-style-type: none"> <li>determines SDI as 0.61 [1 mark]</li> <li>provides appropriate working [1 mark]</li> </ul>								

b) The scientists noted that species richness was the same in 2024 and 2014. Infer how species evenness changed over the 10-year period. Justify your response. [2 marks]

Sample response	The response
<p>Species evenness decreased over the 10-year period. SDI considers both species richness and evenness — the greater the species richness and evenness, the higher the SDI value. As species richness was the same in both years but SDI decreased from 0.84 to 0.61, it can be inferred that species evenness was lower in 2024 than in 2014.</p>	<ul style="list-style-type: none"> <li>infers that species evenness decreased over the 10-year period [1 mark]</li> <li>justifies inference using SDI data [1 mark]</li> </ul>

c) Describe how sampling could be used to collect data for this investigation. Include at least two strategies to minimise bias. [3 marks]

Sample response	The response
<p>Quadrats could be randomly placed throughout the forest, and the number and type of plants observed in each quadrat recorded. This data could then be pooled and used to estimate the total number of each plant species at the site. The researchers could ensure that at least 10% of the site is sampled (by considering number and size of quadrats) and use a random-number generator to decide where to place the quadrats.</p>	<ul style="list-style-type: none"> <li>describes an appropriate surveying technique [1 mark]</li> <li>identifies one strategy to minimise bias [1 mark]</li> <li>identifies a second strategy to minimise bias [1 mark]</li> </ul>

<p><b>2024</b> <b>Paper 1</b> <b>Section 2</b> <b>Question 25</b></p> <p><b>Describing biodiversity</b></p>	<p>Describe what is meant by an interspecific hybrid, using an example. [2 marks]</p>			
	<table border="1"> <thead> <tr> <th>Sample response</th> <th>The response</th> </tr> </thead> <tbody> <tr> <td> <p>An interspecific hybrid is an offspring produced by the mating of individuals from two different species, e.g. a mule, which is the offspring of a horse and a donkey.</p> </td> <td> <ul style="list-style-type: none"> <li>describes interspecific hybrid [1 mark]</li> <li>provides an example [1 mark]</li> </ul> </td> </tr> </tbody> </table>	Sample response	The response	<p>An interspecific hybrid is an offspring produced by the mating of individuals from two different species, e.g. a mule, which is the offspring of a horse and a donkey.</p>

This indicates that overall, biodiversity decreased as percentage cover increased.	<ul style="list-style-type: none"> <li>identifies a relevant trend in the data [1 mark]</li> <li>draws a valid conclusion about the effect of the invasive species [1 mark]</li> </ul>																				
Sample response	The response																								
The presence of the invasive species has a negative effect on biodiversity. While the same number of species were observed in the area when invasive species cover was 0–60% (7, as indicated by species richness), the SDI decreased from 0.83 to 0.3 as percentage cover increased. This indicates that overall, biodiversity decreased as percentage cover increased.	<ul style="list-style-type: none"> <li>identifies a relevant trend in the data [1 mark]</li> <li>draws a valid conclusion about the effect of the invasive species [1 mark]</li> </ul>																								

	c) Explain why having data on species richness and Simpson’s diversity index having is more informative than a single measure for the purpose of this investigation. Refer to the table to support your response. [3 marks]	
	<b>Sample response</b>	<b>The response</b>
	<p>Species richness indicates the number of species that can coexist in the area; however, it doesn’t account for the abundance of each species, so one or two species may be dominating. SDI considers the number of species and their relative abundance (evenness), but the number of species is not obvious from the index.</p> <p>Having both values is more informative because it allows the researcher to identify the number of species in the area (7) and infer evenness from the SDI. For example, the same number of species was present for 0–60% coverage (7), but the evenness was not the same, as the SDI decreased as % coverage got higher.</p>	<ul style="list-style-type: none"> <li>• recognises species richness is the total number of species present [1 mark]</li> <li>• recognises SDI considers species number and abundance/evenness [1 mark]</li> <li>• uses data to explain why data on species richness and SDI is more informative than a single measure [1 mark]</li> </ul>

<b>2022</b> <b>Paper 1</b> <b>Section 2</b> <b>Question 22</b>  <b>Describing biodiversity</b>	Explain how two abiotic factors affect the distribution of species in an ecosystem. [2 marks]	
	<b>Sample Response</b>	<b>The response</b>
	<p>Ecosystem: Rainforest</p> <p>Abiotic factor 1: Availability of light: In a rainforest, light becomes less available in the understorey, so only plants that are adapted to low-light conditions can survive there.</p> <p>Abiotic factor 2: Availability of water: Rainforest frogs need to be distributed near pools of water for their tadpoles to grow and survive.</p>	<ul style="list-style-type: none"> <li>• explains how one abiotic factor affects the distribution of species in the identified ecosystem [1 mark]</li> <li>• explains how a second abiotic factor affects the distribution of species in the identified ecosystem [1 mark]</li> </ul>

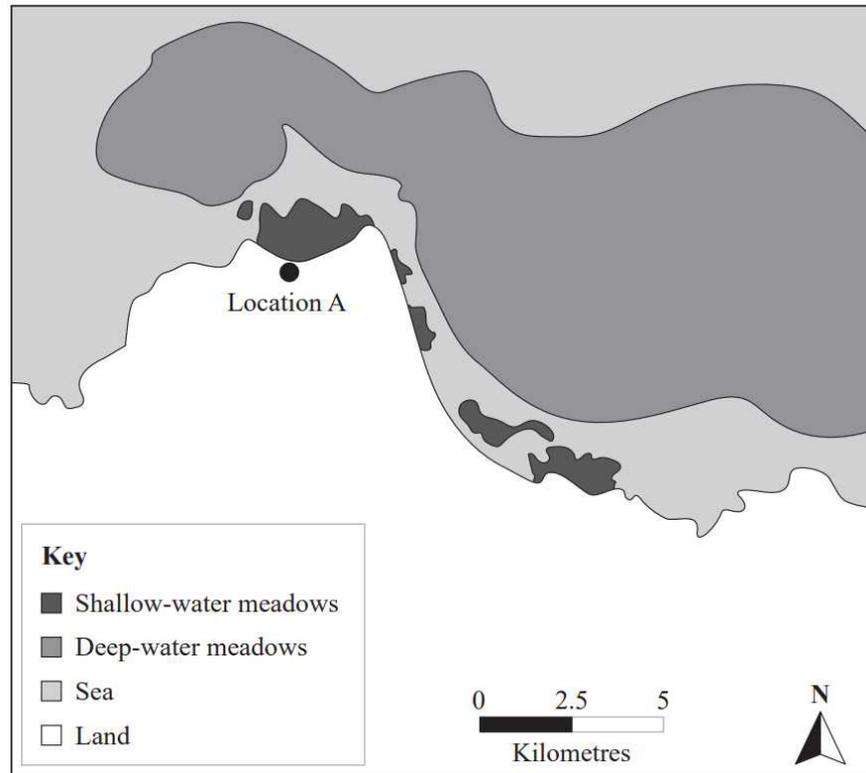

<b>2022</b> <b>Paper 1</b> <b>Section 2</b> <b>Question 24</b>  <b>Describing biodiversity</b>	Explain two ways that classifying ecosystems allows for effective management of old-growth forests. [2 marks]	
	<b>Sample Response</b>	<b>The response</b>
	<p>Classification allows us to document, monitor and communicate information about biodiversity, which can be used to monitor how old-growth forests recover after a disturbance, e.g. the progression from tall open woodland to tall closed forest.</p> <p>Classification can also be used to identify which parts of an area have similar species composition and abiotic factors. This data can be used to inform effective management, as similar management principles would apply to old growth forests with similar species composition.</p>	<ul style="list-style-type: none"> <li>• explains one way classification allows for effective management of old-growth forests [1 mark]</li> <li>• explains a second way classification allows for effective management of old-growth forests [1 mark]</li> </ul>

**2022**  
**Paper 1**  
**Section 2**  
**Question 25**

**Describing biodiversity**

Severe weather events have caused widespread loss of seagrass in meadows off Location A.

Seagrasses have the capacity to recover from weather-associated disturbances and return to pre-impact levels within 4 to 60 months. Deep-water meadows have a higher rate of recovery than shallow-water meadows.

Describe how stratified sampling could be used to study how seagrass meadows off Location A recover after a severe weather event. Identify a surveying technique and purpose for the study in your response. [4 marks]

Sample Response	The response
<p>Stratified sampling could be used to investigate how the percentage cover of seagrass changes along a depth gradient over a 60-month period. Quadrats could be used to estimate the percentage cover of seagrass at 250 m intervals along a 7 km belt transect north of location A, covering both shallow-water and deep-water meadows. Multiple quadrats should be placed at each interval to ensure the reliability of data, and the depth at each sampling point must be recorded. Data could be collected each month for 60 months.</p>	<ul style="list-style-type: none"> <li>• indicates the study will take place over time [1 mark]</li> <li>• indicates that sampling will occur in both deep and shallow water [1 mark]</li> <li>• identifies an appropriate surveying technique [1 mark]</li> <li>• identifies an appropriate purpose for the study [1 mark]</li> </ul>

<p><b>2021</b> <b>Paper 1</b> <b>Section 2</b> <b>Question 21</b></p> <p><b>Describing biodiversity</b></p>	<p>In the Linnaean system of classification, the features used to classify living things change according to taxonomic levels. Describe, using relevant examples, how these features change. [4 marks]</p>	
	<p style="text-align: center;"><b>Sample Response</b></p> <p>The features used to classify living things change as you go from the broader taxonomic level to the more specific.</p> <p>Kingdom is the most extensive, so the features encompass the widest variety of organisms, with features such as cell type and structure.</p> <p>Through the middle taxa, features become more specific, with an emphasis on minor shared similarities such as fur, body shape and leaf shape.</p> <p>At the species level, features such as teeth structure, body size, behaviour and distribution may be used, as well as the more recent use of biochemical similarities.</p>	<p style="text-align: center;"><b>The response</b></p> <ul style="list-style-type: none"> <li>• states that the Linnaean system</li> <li>- starts with broad taxa that have major similarities [1 mark]</li> <li>- has lower taxa that become more specific, with minor similarities [1 mark]</li> <li>• provides a relevant example for broad taxa [1 mark]</li> <li>• provides a relevant example for mid OR narrow taxa [1 mark]</li> </ul>

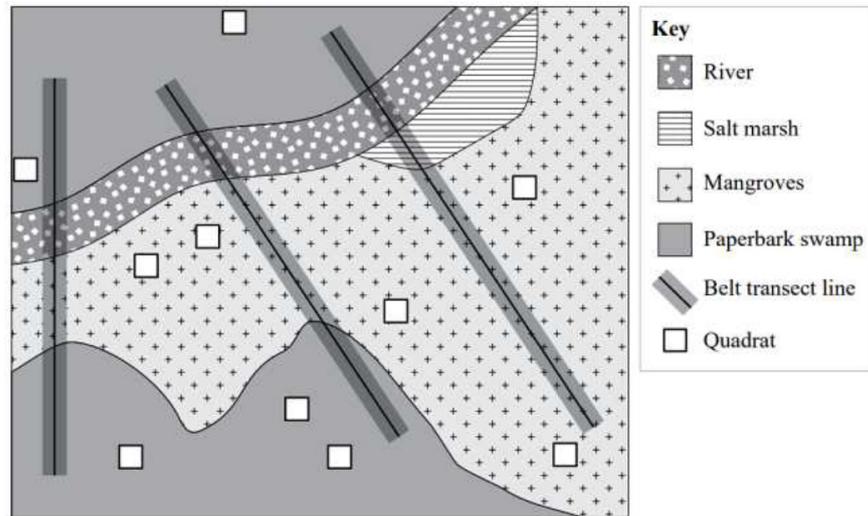

**2021  
Paper 1  
Section 2  
Question 23**

**Describing biodiversity**

To determine the species diversity and species richness of a wetland ecosystem, ecologists surveyed communities adjacent to a river, using two methods for each community:

1. random species sampling with predetermined grid numbers, with 10 quadrats of 4 m<sup>2</sup> each used for these grids.
2. three belt transect lines (50 m×2 m) across predetermined sampling locations based on strata variation.

The map shows the locations of quadrats and transect lines. The table shows survey results.

Not to scale

	Survey method	
	Quadrat	Belt transect
Species diversity (Simpson's diversity index)	0.6	0.8
Species richness (number of species)	16	22

a) Identify three differences between the survey methods used to determine species diversity and species richness in the ecosystem. [3 marks]

Sample Response	The response
<p>Quadrats did not cover salt marsh area but transects were placed throughout the different strata.</p> <p>Quadrats sampled a smaller area of 40 m<sup>2</sup> compared to a larger area of 300 m<sup>2</sup> for transects.</p> <p>Bias was removed in quadrat sampling method by using random sampling, but it wasn't for transects.</p>	<ul style="list-style-type: none"> <li>• identifies first difference [1 mark]</li> <li>• identifies second difference [1 mark]</li> <li>• identifies third difference [1 mark]</li> </ul>

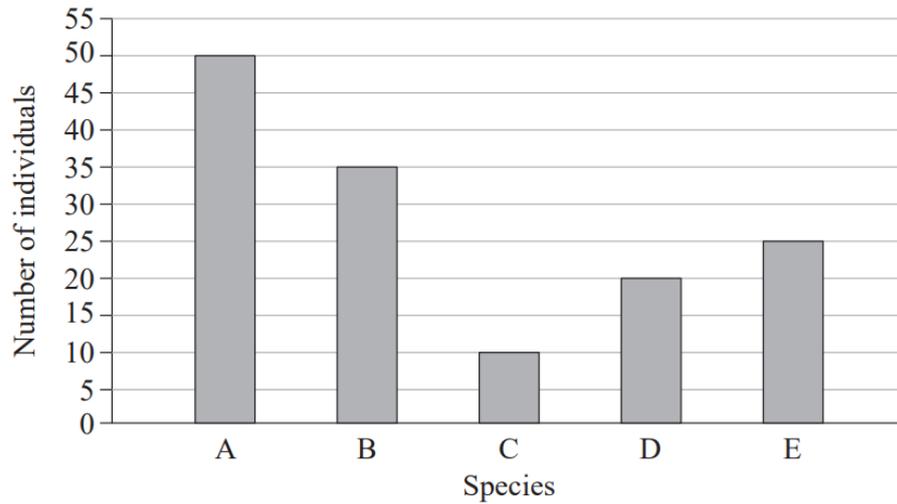

b) Draw a conclusion about the most suitable method for estimating species diversity and species richness of the communities in this wetland ecosystem. Give a reason to support your conclusion. [2 marks]

Sample Response	The response
<p>The belt transect was most the most suitable method as it identified more species.</p>	<ul style="list-style-type: none"> <li>• concludes that the transect method was most suitable [1 mark]</li> <li>• gives a reason [1 mark]</li> </ul>

**2024 Paper 2 Section 1 Question 1**  
**Describing biodiversity**

This cladogram shows the development of key features in species A to G.

a) Identify the most distant relative of species C. [1 mark]

Sample response	The response
Species A	• identifies species A [1 mark]

b) List all the features you would expect to observe in the most recent common ancestor of species C and F. [1 mark]

Sample response	The response
Backbone, bony skeleton, four limbs	• identifies backbone, bony skeleton and four limbs [1 mark]

c) Identify the features that could be used to distinguish between species C and D. [1 mark]

Sample response	The response
Hair and amniotic egg	• identifies hair and amniotic egg [1 mark]

**2024 Paper 2 Section 1 Question 8**  
**Describing biodiversity**

The table shows data from a transect study along a sand dune.

	Zone			
	A	B	C	D
Distance from sea (m)	0–100	>100–150	>150–250	>250–300
Age of dune (years)	0–50	>50–100	>100–125	>125–150
pH of soil	8.4	7.4	6.9	6.0
Organic matter in soil (%)	1	2.5	5	30
Number of grass species	2	4	6	2
Number of tree species	0	1	3	8

a) Contrast species richness in zones A and D. Refer to data in your response. [2 marks]

Sample response	The response
Species richness is five times higher in zone D than zone A. Zone A has two different species, whereas zone D has 10.	• identifies species richness is higher in zone D [1 mark] • provides appropriate data [1 mark]

b) Infer how organic matter affects the pH of soil. Justify your response. [2 marks]

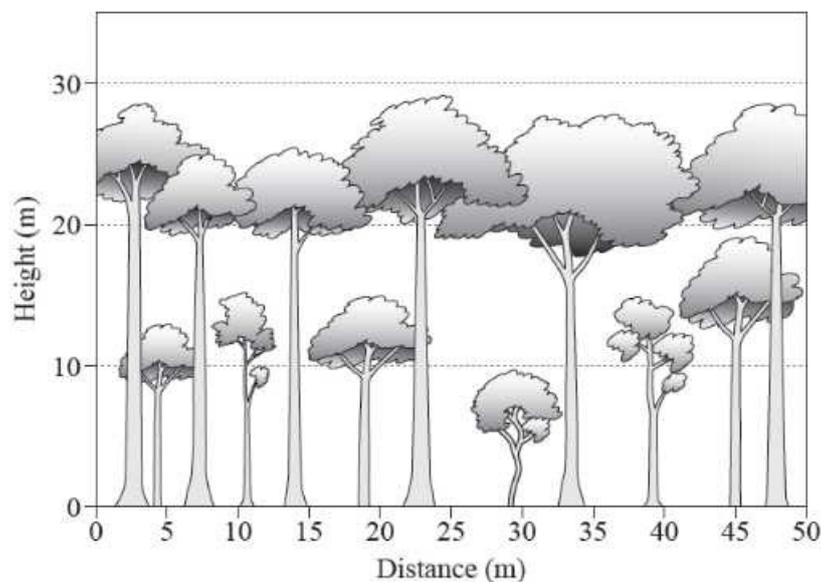

Sample response	The response
As organic matter increased from 1% to 30%, the pH decreased from 8.4 to 6. This suggests that organic matter lowers soil pH.	<ul style="list-style-type: none"> <li>• infers that organic matter lowers soil pH [1 mark]</li> <li>• justifies response using data [1 mark]</li> </ul>

c) Predict which zone would have the highest proportion of K-selected species. Explain your reasoning. [2 marks]

Sample response	The response
Zone D. Zone D is the oldest dune and has the highest species richness. This suggests it may be further along in succession. The number of K-selected species tends to increase as succession progresses.	<ul style="list-style-type: none"> <li>• predicts zone D [1 mark]</li> <li>• provides appropriate reasoning [1 mark]</li> </ul>

2023  
Paper 2  
Section 1  
Question 1  
  
Describing biodiversity

The profile diagram shows a representative section of an ecosystem.

This table can be used to classify ecosystems based on Specht's classification system.

Life form and height of tallest stratum	Foliage cover of tallest plant layer		
	Dense (70–100%)	Mid-dense (30–70%)	Sparse (10–30%)
Trees >30 m	Tall closed-forest	Tall open-forest	Tall woodland
Trees 10–30 m	Closed-forest	Open-forest	Woodland
Trees 5–10 m	Low closed-forest	Low open-forest	Low woodland
Shrubs 2–8 m	Closed-scrub	Open-scrub	Tall shrubland

a) Classify this ecosystem. [1 mark]

Sample response	The response
Closed-forest	<ul style="list-style-type: none"> <li>classifies the ecosystem as closed-forest [1 mark]</li> </ul>

b) Describe how field data could be collected for the purpose of classifying this ecosystem using Specht's classification system. Include at least one strategy to minimise bias. [3 marks]

Sample response	The response
<p>Set up three transects in representative sections of the community. Walk along each transect line, recording data on the height and type of vegetation. Use randomly placed quadrats along each transect line to collect data on percentage foliage cover of the tallest plant layer.</p> <p>Use the data to construct a profile diagram and identify the height and dominant vegetation in the tallest strata.</p> <p>A random number generator could be used to determine the location of quadrats to minimise bias.</p>	<ul style="list-style-type: none"> <li>describes an appropriate technique to collect data on height of tallest plant layer [1 mark]</li> <li>describes an appropriate technique to collect data on percentage foliage cover of the tallest plant layer [1 mark]</li> <li>identifies a strategy for minimising bias [1 mark]</li> </ul>

c) Explain how Specht's classification system could be used to monitor how the ecosystem recovers after a logging event that removes 80% of trees from the tallest plant layer. [2 marks]

Sample response	The response
<p>If the logging event involved removing trees in the tallest plant layer, the percentage foliage cover and tallest plant layer could change. This would change the classification of the ecosystem. Specht's classification system would allow researchers to communicate information about changes in height and percentage cover of the tallest plant layer over time, so the progression back to closed-forest could be monitored.</p>	<ul style="list-style-type: none"> <li>recognises that the logging could change the classification of the ecosystem [1 mark]</li> <li>explains how Specht's classification system allows researchers to monitor recovery [1 mark]</li> </ul>

**2023  
Paper 2  
Section 1  
Question 5**

**Describing  
biodiversity**

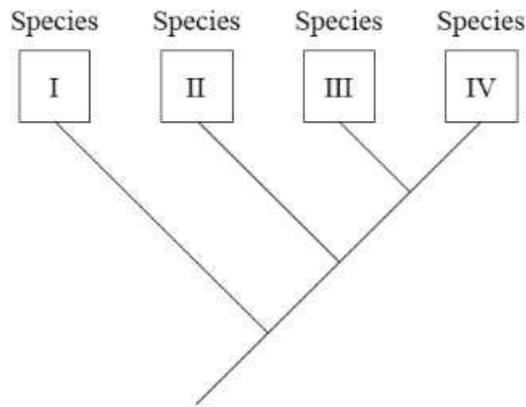

Nucleic acid sequences were used to investigate evolutionary relationships between four species.

Species	Nucleic acid sequence
<i>B. bartonus</i>	GACCGCATTTACGTA
<i>B. deakinii</i>	GACGTCATATCCGTA
<i>B. reidus</i>	GACCGCATTTCCGTA
<i>B. watsonii</i>	GACGGCATATCCGTA

a) Explain how data from conserved molecular sequences can be used to estimate time since divergence. [2 marks]

Sample response	The response
<p>Conserved sequences are assumed to accumulate mutations at a constant rate over time, so time since divergence can be predicted by the amount of genetic difference. Greater genetic difference means more time since divergence.</p>	<ul style="list-style-type: none"> <li>explains that mutations occur at a constant rate in conserved sequences [1 mark]</li> <li>recognises that greater genetic difference corresponds to more time since divergence [1 mark]</li> </ul>

b) Use the data to infer species II-IV in the cladogram. [1 mark]

I: *B. bartonus*

Sample response	The response
I: <i>B. bartonus</i> II: <i>B. reidus</i> III: <i>B. watsonii</i> IV: <i>B. deakinii</i>	• infers species II-IV [1 mark]

**2022  
Paper 2  
Section 1  
Question 9**

**Describing  
biodiversity**

The biological species concept defines species as a group of organisms that can interbreed to produce fertile offspring.

a) Identify another method for defining a species. [1 mark]

Sample Response	The response
Phylogenetic species concept	• identifies another method for defining a species [1 mark]

b) Describe one limitation of the biological species concept and one limitation of the method identified in Question 9a). [2 marks]

Sample Response	The response
A limitation of the biological species concept is that it only applies to sexually reproducing organisms. A limitation of the phylogenetic species concept is that it requires significant morphological differences to allow for appropriate evaluation.	• identifies a limitation of the biological species concept [1 mark] • identifies a limitation of the method identified in Question 9a) [1 mark]

<b>2021 Paper 2 Section 1 Question 6</b>  <b>Describing biodiversity</b>	The term <i>species</i> could be defined as ‘one group of individuals that actually or potentially interbreed in nature’.  Identify two limitations of this definition. [2 marks]				
	<table border="1"> <thead> <tr> <th>Sample Response</th> <th>The response</th> </tr> </thead> <tbody> <tr> <td>           Two limitations are:            1. Sometimes only fossil evidence is available, so a species may be differentiated based on physiological and morphological features.            2. In some areas, hybridisation of plants and animals occurs, yet they are different species.         </td> <td> <ul style="list-style-type: none"> <li>states a limitation [1 mark]</li> <li>states another limitation [1 mark]</li> </ul> </td> </tr> </tbody> </table>	Sample Response	The response	Two limitations are: 1. Sometimes only fossil evidence is available, so a species may be differentiated based on physiological and morphological features. 2. In some areas, hybridisation of plants and animals occurs, yet they are different species.	<ul style="list-style-type: none"> <li>states a limitation [1 mark]</li> <li>states another limitation [1 mark]</li> </ul>
Sample Response	The response				
Two limitations are: 1. Sometimes only fossil evidence is available, so a species may be differentiated based on physiological and morphological features. 2. In some areas, hybridisation of plants and animals occurs, yet they are different species.	<ul style="list-style-type: none"> <li>states a limitation [1 mark]</li> <li>states another limitation [1 mark]</li> </ul>				

<b>2021 Paper 2 Section 1 Question 12</b>  <b>Describing biodiversity</b>	An investigation compared mangrove species diversity for two areas of different size in the same catchment. The table shows species population counts for each area.																			
	<table border="1"> <thead> <tr> <th colspan="2"></th> <th>Area 1</th> <th>Area 2</th> </tr> </thead> <tbody> <tr> <td rowspan="3" style="text-align: center;"><b>Total species count</b></td> <td>Grey mangrove</td> <td style="text-align: center;">37</td> <td style="text-align: center;">7</td> </tr> <tr> <td>Red mangrove</td> <td style="text-align: center;">32</td> <td style="text-align: center;">3</td> </tr> <tr> <td>Yellow mangrove</td> <td style="text-align: center;">25</td> <td style="text-align: center;">88</td> </tr> <tr> <td colspan="2" style="text-align: right;"><b>SDI</b></td> <td style="text-align: center;">0.67</td> <td style="text-align: center;">?</td> </tr> </tbody> </table>					Area 1	Area 2	<b>Total species count</b>	Grey mangrove	37	7	Red mangrove	32	3	Yellow mangrove	25	88	<b>SDI</b>		0.67

Sample Response	The response				
Mutualism means that both species benefit from the interaction. An example is the relationship between zooxanthellae (photosynthesis producing nutrients for coral) and coral polyps (hosting the zooxanthellae, providing home).	<ul style="list-style-type: none"> <li>describes mutualism [1 mark]</li> <li>describes a relevant example where each organism benefits [1 mark]</li> </ul>				

<b>2020</b> <b>Paper 2</b> <b>Section 1</b> <b>Question 4</b>  <b>Describing biodiversity</b>	<p>An ecologist investigated the species composition of mangrove trees in a natural mangrove forest and an adjacent 30-year-old planted mangrove forest.</p> <p>Three 10 m-wide belt transects were sampled from inland to the sea for each of the forests, each covering 100 m on average and placed to cover various strata.</p> <p>The species diversity of Forest A was determined using the Simpson's Diversity Index (SDI):</p> $SDI = 1 - \left( \frac{\sum n(n-1)}{N(N-1)} \right)$ <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th rowspan="2">Species</th> <th colspan="2">Population count</th> </tr> <tr> <th>Forest A (natural)</th> <th>Forest B (planted)</th> </tr> </thead> <tbody> <tr> <td>Grey mangrove</td> <td>91</td> <td>77</td> </tr> <tr> <td>Red mangrove</td> <td>23</td> <td>14</td> </tr> <tr> <td>River mangrove</td> <td>11</td> <td>8</td> </tr> <tr> <td>Orange mangrove</td> <td>3</td> <td>0</td> </tr> <tr> <td><b>Diversity</b></td> <td>0.46</td> <td>?</td> </tr> </tbody> </table>	Species	Population count		Forest A (natural)	Forest B (planted)	Grey mangrove	91	77	Red mangrove	23	14	River mangrove	11	8	Orange mangrove	3	0	<b>Diversity</b>	0.46	?
	Species		Population count																		
Forest A (natural)		Forest B (planted)																			
Grey mangrove	91	77																			
Red mangrove	23	14																			
River mangrove	11	8																			
Orange mangrove	3	0																			
<b>Diversity</b>	0.46	?																			
	<p>a) Use the SDI formula to calculate the diversity index for Forest B. Round your answer to two decimal places. [2 marks]</p> <table border="1"> <thead> <tr> <th>Sample Response</th> <th>The response</th> </tr> </thead> <tbody> <tr> <td> <math display="block">SDI = 1 - \frac{77(77-1) + 14(14-1) + 8(8-1)}{99(99-1)}</math> <math display="block">= 0.37</math> </td> <td> <ul style="list-style-type: none"> <li>demonstrates correct substitution [1 mark]</li> <li>states SDI = 0.37 [1 mark]</li> </ul> </td> </tr> </tbody> </table>	Sample Response	The response	$SDI = 1 - \frac{77(77-1) + 14(14-1) + 8(8-1)}{99(99-1)}$ $= 0.37$	<ul style="list-style-type: none"> <li>demonstrates correct substitution [1 mark]</li> <li>states SDI = 0.37 [1 mark]</li> </ul>																
Sample Response	The response																				
$SDI = 1 - \frac{77(77-1) + 14(14-1) + 8(8-1)}{99(99-1)}$ $= 0.37$	<ul style="list-style-type: none"> <li>demonstrates correct substitution [1 mark]</li> <li>states SDI = 0.37 [1 mark]</li> </ul>																				

b) Identify three reasons why the ecologist used a belt transect rather than line transects or randomly placed quadrats for collecting data to compare these two forests. [3 marks]

Sample Response	The response
Belt transects are used for abundance and distribution of species. Random quadrats can be used for abundance, not distribution, and line transects can be used for distribution, not abundance. Random sampling doesn't take into account strata (different areas) and may not cover all areas of habitat equally, giving inaccurate measures of diversity and abundance.	<ul style="list-style-type: none"> <li>• states 3 reasons = 3 marks</li> <li>• states 2 reasons = 2 marks</li> <li>• states a reason = 1 mark</li> <li>• does not satisfy any of the descriptors above. = 0 marks</li> </ul>

c) Identify one way in which the ecologist minimised bias in the sampling. [1 mark]

Sample Response	The response
The locations of belt transects were chosen to take strata into account.	<ul style="list-style-type: none"> <li>• states a way to minimise bias [1 mark]</li> </ul>

**2020  
Paper 2  
Section 1  
Question 7**

**Describing  
biodiversity**

Species richness (S) can be determined using the Menhinick's Index, where s is the number of different species represented in a sample and N is the total number of individual organisms in the sample.

$$\text{Species richness (S)} = \frac{s}{\sqrt{N}}$$

Sampling of two communities (Community A and Community B) were completed, with Community A having S = 0.5 for the six species identified. The results for Community B are shown in the table.

Community B	
Species	Number of individuals
A	12
B	15
C	19
D	22
E	25
F	7

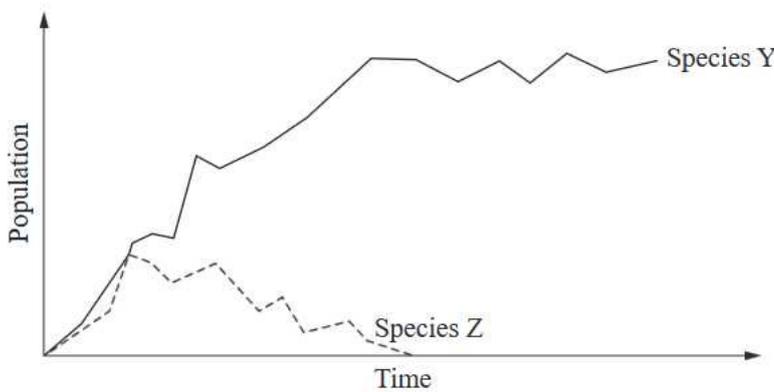

Use S to compare Community A with Community B. [4 marks]

Sample Response	The response
$S = 6/\sqrt{100}$ $= 6/10$ $= 0.6$ Community B has greater richness than Community A. Community B has a same number of different species as Community A (i.e. 6); however, Community A must have been for a larger sample.	<ul style="list-style-type: none"> <li>• states that S = 0.6 [1 mark]</li> <li>• states that Community B has greater richness than Community A [1 mark]</li> <li>• states that Community A and Community B have same number of species [1 mark]</li> <li>• infers that Community B's sample size is smaller than Community A [1 mark]</li> </ul>

## Unit 3 - Topic 2: Ecosystem dynamics

### Paper 1 Section 1

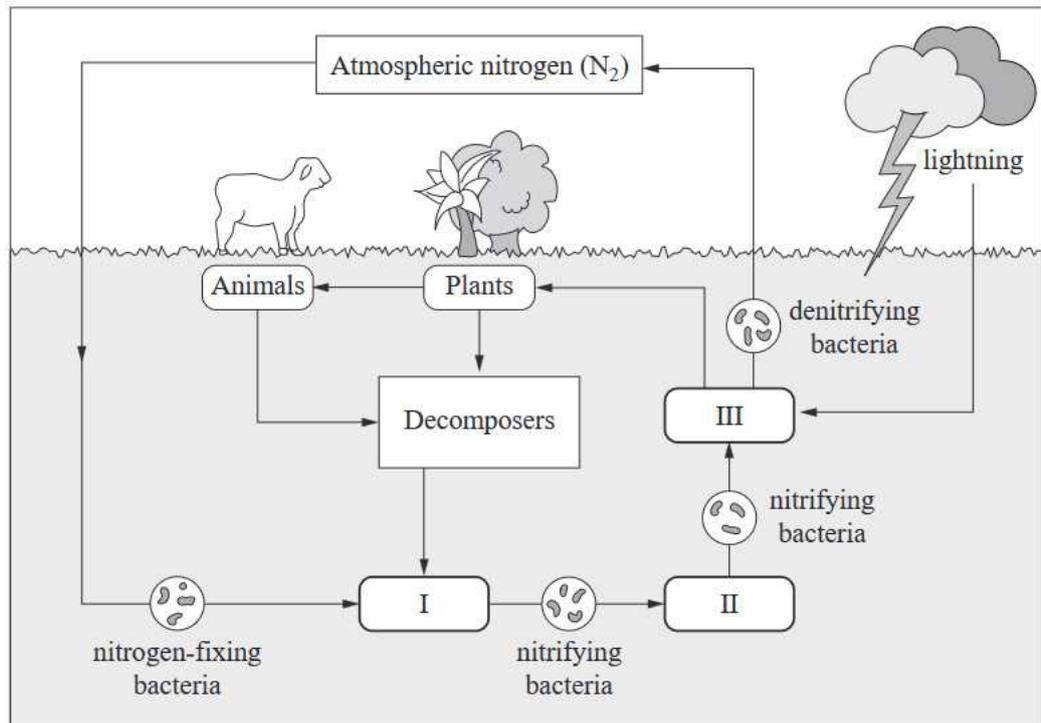

<b>2024 Paper 1 Section 1 Question 4</b>  <b>Ecosystem dynamics</b>	The table shows data on four plant species. Which is most likely to be a pioneer species?	
	Germination rate	Presence of nitrogen-fixing bacteria
	(A)	slow present
	(B)	slow not present
	(C)	rapid present
(D)	rapid not present	

<b>2024 Paper 1 Section 1 Question 9</b>  <b>Ecosystem dynamics</b>	The graph shows how populations of two species living in the same area changed over time.
	 <p>Which species interaction is indicated?</p> <p>(A) predation, where species Y preyed on species Z (B) predation, where species Z preyed on species Y (C) competition, where species Y outcompeted species Z (D) competition, where species Z outcompeted species Y</p>

Paper 1  
Section 1  
Question 4**

**Ecosystem  
dynamics**

The following information includes:

- a key that is used to classify the types of alpine and subalpine grassland habitats
- a table of abiotic and biotic data obtained from a habitat survey.

Abiotic physical parameter	Reading	Reference range for nutrient-poor soil (mg/kg)
pH	6.1	
Nitrates/nitrites (mg/kg)	4	< 5
Ammonia (mg/kg)	1	< 4
Total phosphorous	16	< 20

Biotic description: Small amount of low-lying moss, growing on soil substrate. Predominantly low-lying grasses.

Using the data in the table and the key, this alpine and subalpine grassland would be classified as

- (A) a moss-and-lichen-dominated mountain summit.
- (B) an alpine and subalpine nutrient-enriched grassland.
- (C) a calcareous alpine and subalpine grassland.
- (D) an acidic alpine and subalpine grassland.

**2020  
Paper 1  
Section 1  
Question 6**

**Ecosystem  
dynamics**

The carrying capacity of an ecosystem refers to the

- (A) total biomass of primary producers in the ecosystem at a given time that supports the higher trophic levels.
- (B) size of a population that can be supported indefinitely on the available resources and services of that ecosystem.
- (C) number of individual top predators in the ecosystem at a given time that can be supported by the lower trophic levels.
- (D) maximum population of individuals of different species that the ecosystem can support for an extended period of time.

**2020 Paper 1 Section 1 Question 7**

**Ecosystem dynamics**

When predicting successional change, which of the following would typically indicate that an ecosystem is progressing toward its climax community?

	Abundance of K-selected species	Biomass
(A)	Increasing	Decreasing
(B)	Decreasing	Increasing
(C)	Increasing	Increasing
(D)	Decreasing	Decreasing

**2020 Paper 1 Section 1 Question 8**

**Ecosystem dynamics**

The table shows the daily energy input and output for a typical leaf.

Process	Energy value (kJ)
Incident sunlight	42.3
Evaporation	31.2
Heat loss (radiation)	2.1
Reflection of sunlight	6.1
Transmission of sunlight	2.1

Calculate the daily net energy stored by the leaf.

(A) 0.8 kJ  
 (B) 5.0 kJ  
 (C) 36.2 kJ  
 (D) 73.5 Kj

**2020 Paper 1 Section 1 Question 9**

**Ecosystem dynamics**

The table provides population statistics for a species of tree kangaroo in northern Queensland.

Year	Births	Deaths	Immigration	Emigration	Final population
2016	253	175	153	131	1100
2017	290	167	182	140	

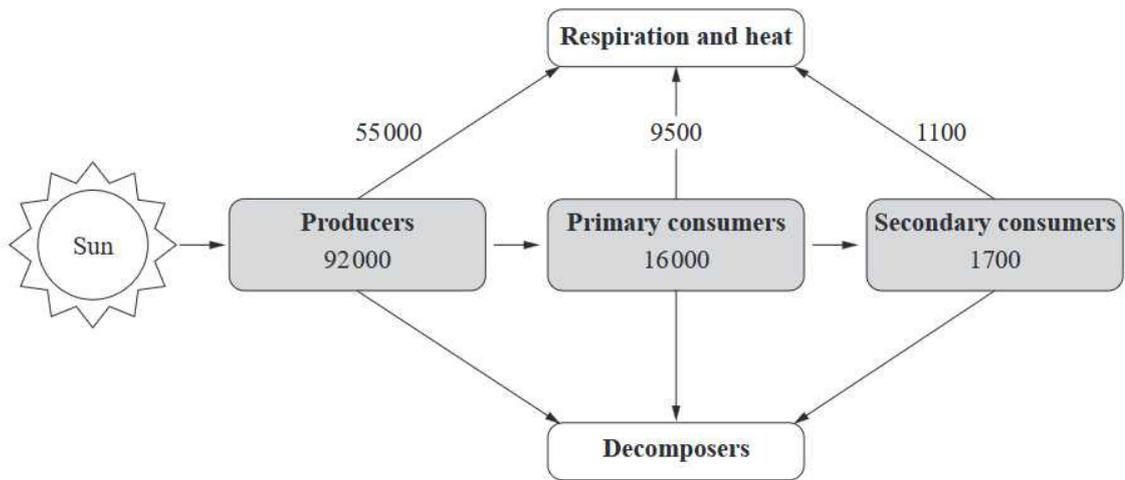

Determine the population growth rate for tree kangaroos in 2017.

(A) 14.6%  
 (B) 15.0%  
 (C) 26.5%  
 (D) 86.9%

a) Calculate the efficiency of energy transfer between primary and secondary consumers. Show your working. [2 marks]

Sample response	The response
Transfer efficiency = $(1700/16\ 000) \times 100\%$ = 11%	<ul style="list-style-type: none"> <li>determines transfer efficiency [1 mark]</li> <li>provides appropriate working [1 mark]</li> </ul>

b) Determine the amount of energy lost to decomposers at the producer level. Show your working. [2 marks]

Sample response	The response
Energy lost to decomposers = $92\ 000 - (55\ 000 + 16\ 000)$ = $21\ 000 \text{ kJ m}^{-2} \text{ year}^{-1}$	<ul style="list-style-type: none"> <li>determines 21 000 [1 mark]</li> <li>provides appropriate working [1 mark]</li> </ul>

c) Describe two ways energy is transformed in this ecosystem. [2 marks]

Sample response	The response
Primary producers convert solar energy into chemical energy in the form of glucose through photosynthesis. At each level of the food chain some chemical energy is transformed into heat energy as organisms use it to drive their biochemical processes (respiration).	<ul style="list-style-type: none"> <li>describes one way energy is transformed [1 mark]</li> <li>describes a second way energy is transformed [1 mark]</li> </ul>

**2024 Paper 1 Section 2 Question 27**  
Ecosystem dynamics

To determine the reliability of the capture–recapture technique and the Lincoln index  $N = \frac{M \times n}{m}$ , two researchers collected data on a mouse population from the same site at the same time.

Researcher	Number of mice in first capture	Number of mice in second capture	Number of marked mice in second capture
I	160	140	80
II	100	60	?

	If the reliability of the technique is high, how many marked mice would be expected in the second capture for researcher II? Show your working.	
	<b>Sample response</b>	<b>The response</b>
	$N(\text{researcher I}) = \frac{M \times n}{m}$ $= \frac{160 \times 140}{80}$ $= 280$ $280 = \frac{100 \times 60}{m(\text{researcher II})}$ $m = \frac{100 \times 60}{280}$ $= 21 \text{ mice}$	<ul style="list-style-type: none"> <li>calculates <math>N</math> for researcher I [1 mark]</li> <li>determines expected <math>m</math> for researcher II [1 mark]</li> </ul>

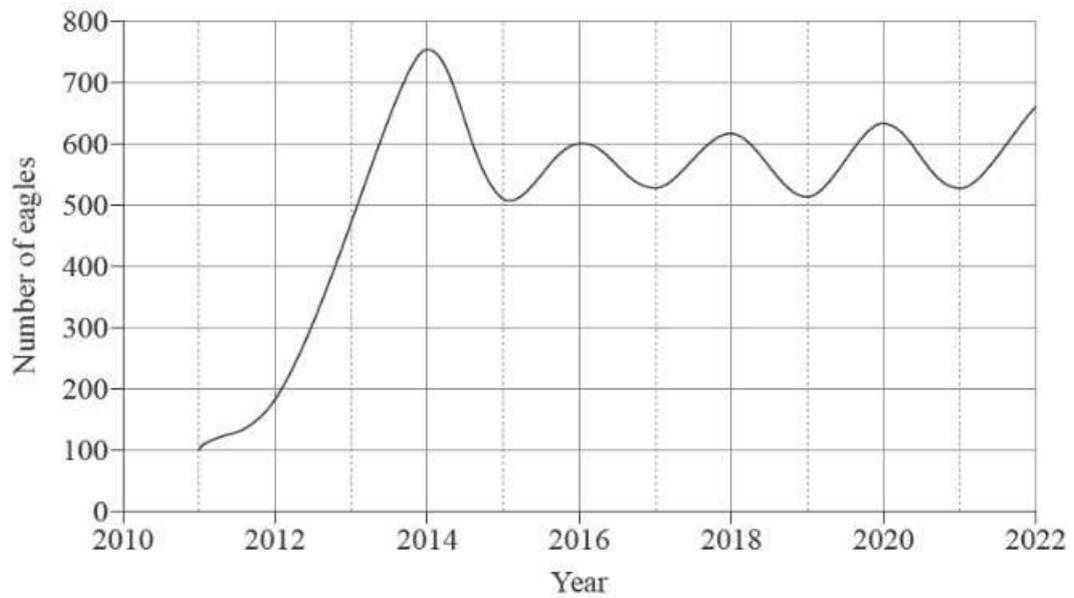

<b>2023</b> <b>Paper 1</b> <b>Section 2</b> <b>Question 22</b>  <b>Ecosystem dynamics</b>	Describe two ways bacteria assist matter to cycle through ecosystems. [2 marks]	
	<b>Sample response</b>	<b>The response</b>
	<p>Heterotrophic bacteria break down dead remains and organic waste into CO<sub>2</sub>, which is released into the atmosphere for use by plants in photosynthesis.</p> <p>Nitrogen-fixing bacteria convert atmospheric nitrogen into nitrates, which can be used by plants for protein synthesis.</p>	<ul style="list-style-type: none"> <li>describes a way that bacteria assist matter to cycle through ecosystems [1 mark]</li> <li>describes another way that bacteria assist matter to cycle through ecosystems [1 mark]</li> </ul>

**2023  
Paper 1  
Section 2  
Question 26**

**Ecosystem  
dynamics**

Wedge-tailed eagles are large birds that reside in tall trees, where they build nests for their young. They often feed on ground-dwelling herbivores such as kangaroos and rabbits.

The graph shows the number of wedge-tailed eagles observed in an ecosystem over time. [3 marks]

a) Determine the carrying capacity of wedge-tailed eagles in this ecosystem. [1 mark]

Sample response	The response
Approximately 550	<ul style="list-style-type: none"> <li>identifies carrying capacity [1 mark]</li> </ul>

b) Explain how a change to one abiotic factor could reduce the carrying capacity. [2 marks]

Sample response	The response
Natural disasters (such as bushfire) could remove trees from the ecosystem, affecting the availability of nesting sites. This would reduce the number of offspring the ecosystem could support.	<ul style="list-style-type: none"> <li>identifies an abiotic factor that could reduce the carrying capacity [1 mark]</li> <li>explains how a change to this abiotic factor could reduce the carrying capacity [1 mark]</li> </ul>

<b>2022</b> <b>Paper 1</b> <b>Section 2</b> <b>Question 21</b>  <b>Ecosystem dynamics</b>	Describe two reproductive strategies used to distinguish K-strategists from r-strategists. [2 marks]	
	Sample Response	The response
	Strategy 1: Number of offspring — K-strategists have fewer offspring than r-strategists.	<ul style="list-style-type: none"> <li>describes one reproductive strategy used to distinguish K-strategists from r-strategists [1 mark]</li> </ul>
Strategy 2: Age of reproduction — K-strategists reproduce at a later age than r-strategists.	<ul style="list-style-type: none"> <li>describes a second reproductive strategy used to distinguish K-strategists from r-strategists [1 mark]</li> </ul>	

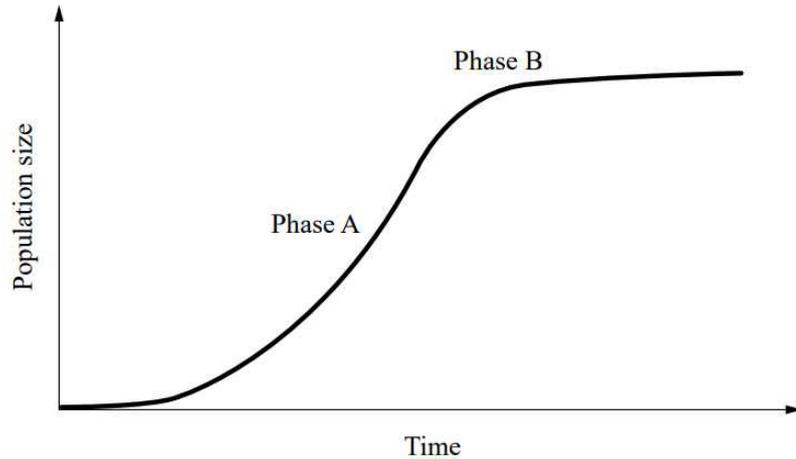

<b>2021</b> <b>Paper 1</b> <b>Section 2</b> <b>Question 22</b>  <b>Ecosystem dynamics</b>	Describe two ways carbon is transformed and one way it is transferred as it cycles through the biotic components of an ecosystem. [3 marks]	
	Sample Response	The response
	Atmospheric carbon exists mainly as carbon dioxide, which is transformed from carbon dioxide gas to produce glucose (and other complex organic molecules) via photosynthesis. This also covers the transfer from atmosphere to plants by diffusion. Respiration transforms glucose into carbon dioxide.	<ul style="list-style-type: none"> <li>states 1 transformation [1 mark]</li> <li>states another transformation [1 mark]</li> <li>states 1 transfer [1 mark]</li> </ul>

<b>2021</b> <b>Paper 1</b> <b>Section 2</b> <b>Question 24</b>  <b>Ecosystem dynamics</b>	The diagram is a hypothetical biomass pyramid for a community.	
	a) Contrast the efficiency of the biomass transfers between each level of the pyramid. [3 marks]	
	Sample Response	The response
	Producers → Primary consumers 10% Primary → Secondary consumers 5% The ecosystem shows a drop in efficiency of transfer of biomass from 10% to 5%.	<ul style="list-style-type: none"> <li>provides</li> <li>for producers to primary consumers, 10% [1 mark]</li> <li>for primary to secondary consumers, 5% [1 mark]</li> <li>contrasts efficiency [1 mark]</li> </ul>
	b) Explain the difference in biomass transfer efficiency identified in Question 24a). [2 marks]	
	Sample Response	The response
	As you move through to higher trophic levels, a higher proportion of the energy is lost to respiration and heat, and to decomposers. Overall, a smaller percentage is passed on to the next trophic level.	<ul style="list-style-type: none"> <li>states that higher trophic levels lose a higher proportion of their energy due to other processes [1 mark]</li> <li>states at least one process [1 mark]</li> </ul>

Question 2

Ecosystem dynamics

The diagram shows feeding relationships for an Australian ecosystem.

*Copyright restrictions prohibit the release of this QCAA exam material.*

a) Use the data to explain why dingoes are a keystone species. [2 marks]

Sample response	The response
Based on this food web, the dingo is a predator for kangaroos, echidnas, wombats, emus and lizards. If dingoes were removed, the populations of these species would flourish, adding increased strain on their prey and potentially increasing competition for grasses. This would have a significant effect on the community structure at each trophic level and therefore energy flow through the ecosystem.	<ul style="list-style-type: none"> <li>recognises the critical role of dingoes in maintaining the structure of the community [1 mark]</li> <li>uses data from the food web to support response [1 mark]</li> </ul>

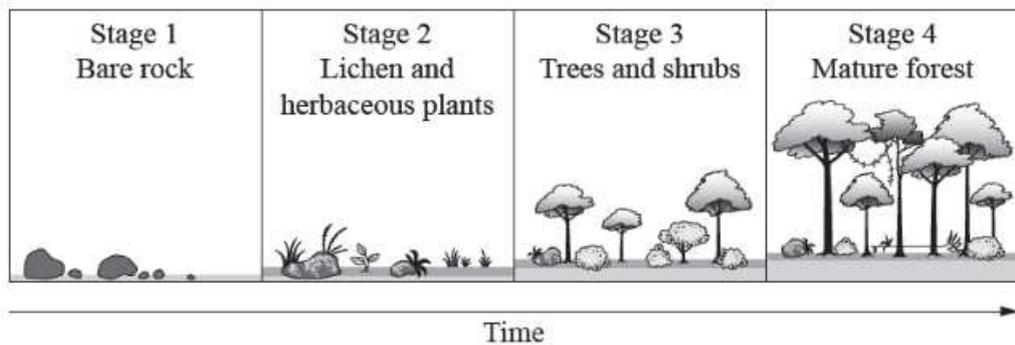

b) Predict the effect a drastic reduction in the number of dingoes would have on the termite population. Justify your response. [2 marks]

Sample response	The response
A reduction in dingo numbers would cause termite numbers to decrease because kangaroos and wombats would lose a predator. This would cause numbers for both to increase, increasing competition with termites for grasses.	<ul style="list-style-type: none"> <li>predicts termite numbers would decrease [1 mark]</li> <li>justifies based on species interactions [1 mark]</li> </ul>

Question 7

Ecosystem dynamics

The diagram shows the stages of succession in an ecosystem.

a) Identify the type of ecological succession depicted. Explain your reasoning. [2 marks]

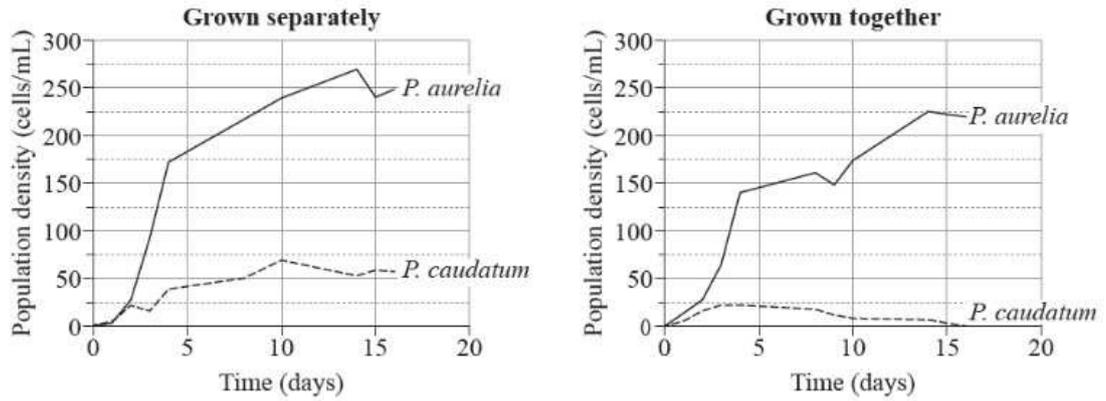

Sample response	The response
Primary succession. The image depicts the colonisation of a barren landscape.	<ul style="list-style-type: none"> <li>identifies primary succession [1 mark]</li> <li>provides appropriate reasoning [1 mark]</li> </ul>

b) Infer two features of the species in stage 2 and describe the role of these species in ecological succession. [3 marks]

Sample response	The response
Two key features of a pioneer species are that they can tolerate extreme conditions and photosynthesise. Their role is to make the area more habitable for the next colonisers.	<ul style="list-style-type: none"> <li>infers a key feature [1 mark]</li> <li>infers another key feature [1 mark]</li> <li>describes the role of pioneer species in ecological succession [1 mark]</li> </ul>

2023  
Paper 2  
Section 1  
Question 9  
  
Ecosystem  
dynamics

The graphs show the findings of an experiment investigating the competitive exclusion principle. Two species of protozoa (*P. aurelia* and *P. caudatum*) were grown separately and together under identical conditions.

a) Identify the population density of *P. caudatum* on day 10 when grown separately. [1 mark]

Sample response	The response
70 cells/mL	<ul style="list-style-type: none"> <li>identifies 70 [1 mark]</li> </ul>

b) Compare the growth of *P. aurelia* in the two graphs. [3 marks]

Sample response	The response
<p><i>P. aurelia</i> follows a similar growth pattern when grown separately and together with <i>P. caudatum</i>, exhibiting exponential growth from day 1–4 and then continuing to increase in population density up until day 14, when the number of cells/mL starts to decrease. The difference is, when grown with <i>P. caudatum</i>, the maximum number of cells only reaches ~225 cells/mL, as opposed to ~273 when grown separately. This indicates that <i>P. aurelia</i> is still able to grow effectively in the presence of <i>P. caudatum</i>, but does experience some inhibition.</p>	<ul style="list-style-type: none"> <li>identifies a similarity [1 mark]</li> <li>identifies a difference [1 mark]</li> <li>states the significance [1 mark]</li> </ul>

c) Use the data to explain the competitive exclusion principle. [3 marks]

Sample response	The response
<p>The competitive exclusion principle states that two species cannot coexist indefinitely if they occupy the same niche, because they will compete for identical resources. This competition will eventually lead to exclusion of the weaker species unless they evolve to have a more distinct niche. This principle is demonstrated in the experiment because both <i>P. aurelia</i> and <i>P. caudatum</i> grow well individually, but when they are grown together, <i>P. aurelia</i> outcompetes the <i>P. caudatum</i>, causing its population to die out by day 16.</p>	<ul style="list-style-type: none"> <li>explains the competitive exclusion principle [1 mark]</li> <li>identifies that both species grow well individually [1 mark]</li> <li>identifies that <i>P. aurelia</i> outcompetes <i>P. caudatum</i> when grown together [1 mark]</li> </ul>

**2022 Paper 2 Section 1 Question 2**  
Ecosystem dynamics

This is a biomass pyramid for a grassland community.

Not to scale

a) Calculate the percentage energy transfer between the first two trophic levels. Show your working. [2 marks]

Sample Response	The response
Energy transfer = $36/900 \times 100\% = 4\%$	<ul style="list-style-type: none"> <li>correctly calculates energy transfer [1 mark]</li> <li>shows appropriate working [1 mark]</li> </ul>

b) Explain the loss of biomass between trophic levels. [2 marks]

Sample Response	The response
At each trophic level, some energy is lost to respiration and decomposition. In these processes, organic compounds that contribute to biomass are converted into inorganic substances, such as CO <sub>2</sub> and H <sub>2</sub> O.	<ul style="list-style-type: none"> <li>identifies a process that accounts for loss of biomass [1 mark]</li> <li>explains the process [1 mark]</li> </ul>

**2022 Paper 2 Section 1 Question 3**  
Ecosystem dynamics

A glacier has retreated, leaving a large amount of gravel, small rocks, sand and mud.

a) Explain the steps of succession that would occur if the glacier continues to retreat. [3 marks]

Sample Response	The response
Pioneer species, such as lichens will begin the process of soil formation by breaking down the substrate and adding organic material through their own death and decay. This will allow new species to colonise/inhabit the area, changing the community composition. The community composition will continue to change over time until a climax community is established.	<ul style="list-style-type: none"> <li>explains               <ul style="list-style-type: none"> <li>pioneer species' role in establishing soil [1 mark]</li> <li>changes in community composition [1 mark]</li> <li>establishment of a climax community [1 mark]</li> </ul> </li> </ul>

b) Identify the type of ecological succession. [1 mark]

Sample Response	The response
Primary succession	<ul style="list-style-type: none"> <li>identifies primary succession [1 mark]</li> </ul>

**2022 Paper 2 Section 1 Question 4**  
Ecosystem dynamics

Define keystone species. (1 mark)

Sample Response	The response
A plant or animal that plays a unique and crucial role in the way an ecosystem functions.	<ul style="list-style-type: none"> <li>provides an appropriate definition [1 mark]</li> </ul>

2022  
Paper 2  
Section 1  
Question 6

Ecosystem  
dynamics

An environmental report identified overexploitation, habitat destruction and pollution as human activities affecting biodiversity in Australia. The tables show the estimated impact of each activity in 2011 and 2016.

Human activities	2011						2016						
	Assessment grade				Confidence		Assessment grade				Confidence		
	Very high impact	High impact	Low impact	Very low impact	In grade	In trend	Very high impact	High impact	Low impact	Very low impact	In grade	In trend	
Over-exploitation													
Habitat destruction													
Pollution													

Recent trends	Grade	Confidence
Improving	<b>Very low impact:</b> Few, if any, species and/or ecosystems are suffering substantial adverse effects from this pressure	<b>Adequate:</b> Adequate high-quality evidence <b>and</b> high level of consensus
Getting worse	<b>Low impact:</b> A small proportion of species and/or ecosystems are suffering substantial adverse effects from this pressure	<b>Somewhat adequate:</b> Adequate high-quality evidence <b>or</b> high level of consensus
Stable	<b>High impact:</b> A significant proportion of species and/or ecosystems are suffering substantial adverse effects from this pressure	<b>Limited:</b> Limited evidence <b>or</b> limited consensus
	<b>Very high impact:</b> A large proportion of species and/or ecosystems are suffering substantial adverse effects from this pressure	<b>Very limited:</b> Limited evidence <b>and</b> limited consensus

a) Explain how one human activity identified in the tables could reduce biodiversity. [1 mark]

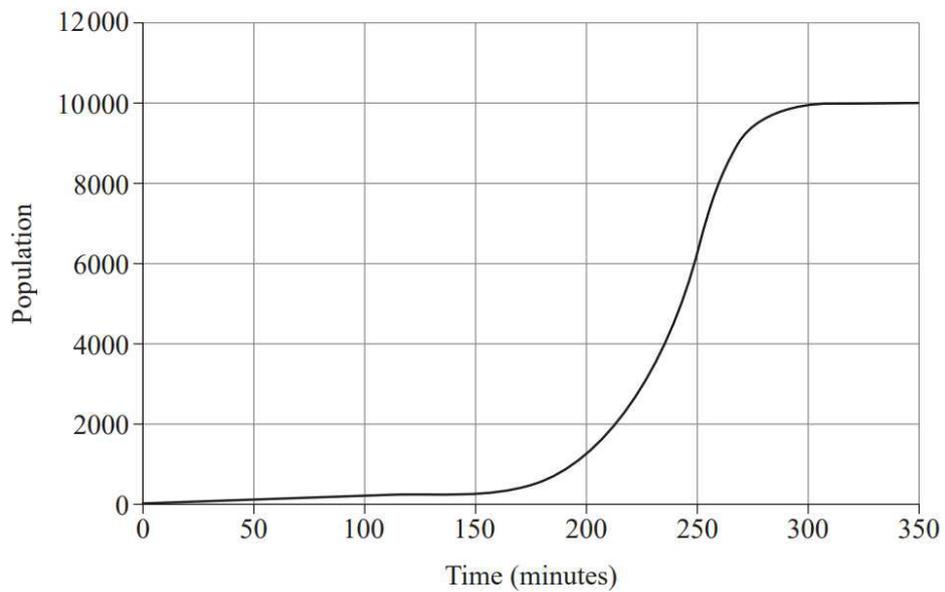

Sample Response	The response
Habitat destruction: organisms that previously inhabited the site are displaced or killed, which could disrupt food chains	• explains how a human activity reduces biodiversity [1 mark]

b) Predict which human activities will have the highest and lowest impact on biodiversity in 2023. Explain your reasoning using evidence from the tables. [4 marks]

Sample Response	The response
Highest impact: Habitat destruction In 2016, there was high-quality evidence and a high level of consensus that habitat destruction was causing a large proportion of species and/or ecosystems to suffer substantial adverse effects, and that the impact was deteriorating. This is in contrast to 2011, when the effects of the impact were improving	<ul style="list-style-type: none"> <li>• predicts the highest impact will be from habitat destruction [1 mark]</li> <li>• explains the prediction using evidence [1 mark]</li> </ul>
Lowest impact: Overexploitation In 2016, there was adequate high-quality evidence to suggest that overexploitation was affecting only a small proportion of species and/or ecosystems. This was an improvement from 2011 where there was high-quality evidence (and consensus) that a large proportion of species were affected. This implies that measures to improve overexploitation have been implemented since 2011.	<ul style="list-style-type: none"> <li>• predicts the lowest impact will be from overexploitation [1 mark]</li> <li>• explains the prediction using evidence [1 mark]</li> </ul>

Explain how one abiotic and one biotic factor will affect the population of mosquito larvae in a freshwater pond. [4 marks]

Sample Response	The response
<p>An abiotic factor that would affect population would be temperature, because warmer water will evaporate faster, reducing the carrying capacity by limiting space.</p> <p>A biotic factor that would affect population would be food availability, because more food (e.g. algae or plankton) would result in a larger population of mosquito larvae.</p>	<ul style="list-style-type: none"> <li>states a <ul style="list-style-type: none"> <li>- relevant abiotic factor [1 mark]</li> <li>- relevant biotic factor [1 mark]</li> </ul> </li> <li>explains the effect of the identified <ul style="list-style-type: none"> <li>- relevant abiotic factor [1 mark]</li> <li>- relevant biotic factor [1 mark]</li> </ul> </li> </ul>

<b>2021</b> <b>Paper 2</b> <b>Section 1</b> <b>Question 3</b>  <b>Ecosystem dynamics</b>	In coastal areas and deserts, bare sand dunes may be colonised by plants such as members of the Poaceae family (grasses). Identify three features of these plants that make them effective colonisers. [3 marks]	
	<b>Sample Response</b>	<b>The response</b>
	Features that make these plants effective colonisers of dunes are that they grow rapidly, their seeds are dispersed by the wind and they are tolerant of the extreme heat and dryness of the environment.	<ul style="list-style-type: none"> <li>• identifies first feature [1 mark]</li> <li>• identifies second feature [1 mark]</li> <li>• identifies third feature [1 mark]</li> </ul>

**2021**  
**Paper 2**  
**Section 1**  
**Question 13**  
  
**Ecosystem dynamics**

The data shows changes in relative abundance of ground cover, biomass and species diversity for an abandoned sand mine site over time.

**Key**  
 Bare ground  
 Grasses (e.g. spinifex, tussock grass)  
 Seedlings/shrubs (e.g. banksia, eucalypt)  
 Leaf litter  
 Mature trees

**Key**  
 Biomass  
 Species diversity

Based on the information provided, predict whether further ecological succession would occur in this community. Justify your answer with two relevant reasons. [3 marks]

<b>Sample Response</b>	<b>The response</b>
It is likely that no further ecological succession would occur — this appears to be a climax community as there is levelling in the biomass and biodiversity, a range of shrubs, trees and grasses with mature trees making up a large proportion of the community and the dominant species are K-selected (mature trees).	<ul style="list-style-type: none"> <li>• predicts no further succession [1 mark]</li> <li>• provides a relevant reason [1 mark]</li> <li>• provides another relevant reason [1 mark]</li> </ul>

**2020  
Paper 2  
Section 1  
Question 2**

**Ecosystem  
dynamics**

Two species of *Paramecium*, single-celled microorganisms, were grown for 4 days in test tubes with a fixed amount of algae added to each tube daily as their food source. The life span for each species ranges from 4–6 hours.

Test tubes 1 and 2 each contained a single species, and test tube 3 initially contained both species.

Live <i>Paramecium</i> population after 4 days (per mL)		
Test tube	Species A	Species B
1	245	0
2	0	104
3	120	0

a) Identify and describe the ecological principle that relates to these observations. [2 marks]

Sample Response	The response
The competitive exclusion principle, which states that two species cannot occupy the same niche at the same time	<ul style="list-style-type: none"> <li>states competitive exclusion [1 mark]</li> <li>describes that two species cannot occupy the same niche simultaneously [1 mark]</li> </ul>

b) Explain the results of the experiment. [3 marks]

Sample Response	The response
<p>Species A would have had an advantage over Species B, as it is better able to compete for the same resource. This can be identified in test tubes 1 and 2 where after 4 days the population was higher for A, possibly indicating a higher rate of reproduction.</p> <p>Therefore, A would have outcompeted B for the same algal food source available, algae, and after 4 days the population was not sustainable for B and they all died.</p> <p>Species A's numbers were lower after 4 days due to the competition for the same resource.</p>	<ul style="list-style-type: none"> <li>identifies that</li> <li>-Species A and B competed for the same resource [1 mark]</li> <li>-Species A outcompeted Species B [1 mark]</li> <li>-Species A's population was affected by the competition [1 mark]</li> </ul>

**2020  
Paper 2  
Section 1  
Question 6**

**Ecosystem  
dynamics**

The Bush Stone-curlew is a large, mainly nocturnal, ground-dwelling bird found on Hamilton Island. Bush Stone-curlews have a wide-ranging diet but prefer to feed on insects, molluscs, small lizards, seeds and, occasionally, small mammals. During the breeding season, nesting birds will search for food in the vicinity of the nest site.

a) Identify one factor that would influence carrying capacity on the island. [1 mark]

Sample Response	The response
Food availability	<ul style="list-style-type: none"> <li>identifies a resource or service of an ecosystem [1 mark]</li> </ul>

b) Discuss one way the carrying capacity of the Bush Stone-curlew on Hamilton Island could be positively or negatively affected in the future. [2 marks]

Sample Response	The response
A future limiting factor, negatively affecting the carrying capacity, could include development on the island (new villas, roads etc. taking away space for the curlew's nesting sites).	<ul style="list-style-type: none"> <li>describes a relevant cause [1 mark]</li> <li>discusses the relevant consequence [1 mark]</li> </ul>

**2020  
Paper 2  
Section 1  
Question 8**

**Ecosystem  
dynamics**

In an experiment studying the population dynamics of the house fly, two adult house flies were placed in a fly cage with a limited food supply. Population data was collected, as summarised in the table.

Generation	Number of eggs	Number of larvae	Number of pupae	Number of adults
1	0	0	0	2
2	120	110	95	88
3	250	225	213	210
4	500	475	462	12
5	20	2	0	0

Determine the population growth model exhibited by the house fly. Explain your reasoning. [3 marks]

Sample Response	The response
Initially there is a rapid increase in growth. This is followed by a sudden drop in population numbers. This pattern is typical for J-curve population growth.	<ul style="list-style-type: none"> <li>• states initial rapid population increase [1 mark]</li> <li>• states sudden population drop [1 mark]</li> <li>• states J-curve [1 mark]</li> </ul>

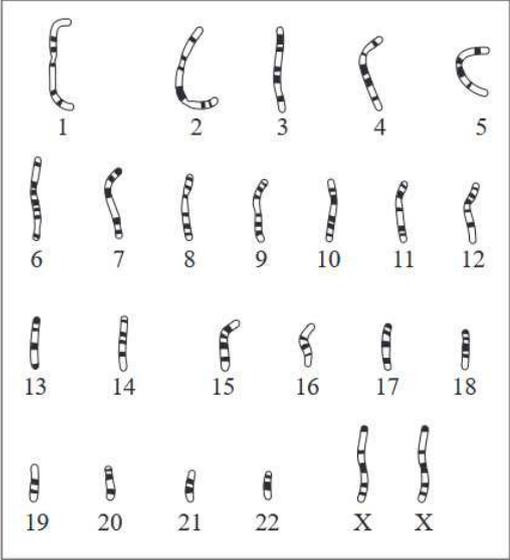

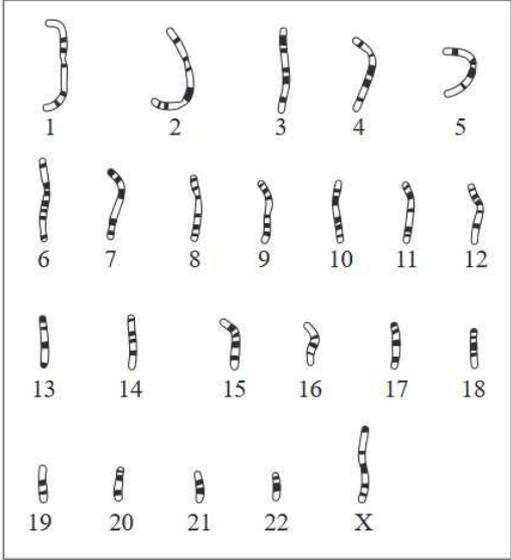

## Unit 4 – Heredity and continuity of life

### Unit 4 – Topic 1: DNA, genes and the continuity of life

#### Paper 1 Section 1

<b>2024 Paper 1 Section 1 Question 2</b>  <b>DNA, genes and the continuity of life</b>	<p>Polymerase chain reaction is a technique used in DNA profiling to</p> <p>(A) cut DNA at specific sites. (B) create more copies of DNA. (C) determine the order of nucleotides. (D) separate DNA fragments based on size.</p>
<b>2024 Paper 1 Section 1 Question 3</b>  <b>DNA, genes and the continuity of life</b>	<p>What is a key difference between spermatogenesis and oogenesis?</p> <p>(A) Spermatogenesis produces haploid cells, whereas oogenesis produces diploid cells. (B) Spermatogenesis produces four functional gametes, whereas oogenesis produces one. (C) Spermatogenesis occurs throughout life, whereas oogenesis only occurs after puberty. (D) Spermatogenesis begins with haploid cells, whereas oogenesis begins with diploid cells.</p>
<b>2024 Paper 1 Section 1 Question 6</b>  <b>DNA, genes and the continuity of life</b>	<p>What can introduce new alleles into a population?</p> <p>(A) point mutations (B) non-disjunction (C) random fertilisation (D) independent assortment</p>
<b>2024 Paper 1 Section 1 Question 10</b>  <b>DNA, genes and the continuity of life</b>	<p>A key function of histones is to</p> <p>(A) add nucleotides to a growing DNA strand. (B) bind to specific sections of DNA to initiate replication. (C) allow DNA to tightly condense so it fits into the nucleus. (D) join amino acids to form a polypeptide chain during translation</p>
<b>2024 Paper 1 Section 1 Question 11</b>  <b>DNA, genes and the continuity of life</b>	<p>Which mode of inheritance leads to continuous variation in the phenotypes of a population due to the cumulative effect of multiple genes?</p> <p>(A) codominance (B) polygenic inheritance (C) incomplete dominance (D) multiple allele inheritance</p>

<p><b>2024</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 17</b></p> <p><b>DNA, genes and the continuity of life</b></p>	<p>Which genetic tool is <b>not</b> required to make recombinant DNA?</p> <p>(A) DNA ligase (B) plasmid vectors (C) restriction enzymes (D) transcription factors</p>
---	---

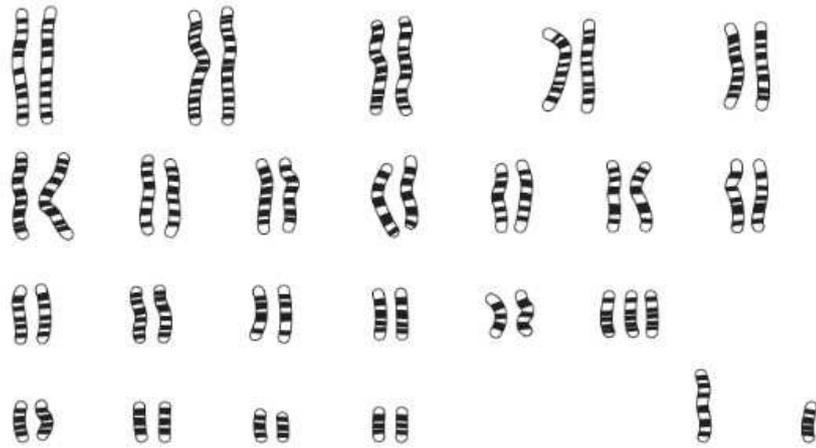

<p><b>2024</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 18</b></p> <p><b>DNA, genes and the continuity of life</b></p>	<p>Karyotypes for two human gametes are shown.</p> <div style="display: flex; justify-content: space-around;">   </div> <p>If the two gametes produced a zygote, the resulting embryo would be</p> <p>(A) male, with trisomy. (B) female, with trisomy. (C) male, with monosomy. (D) female, with monosomy.</p>
---	--

<p><b>2023</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 5</b></p> <p><b>DNA, genes and the continuity of life</b></p>	<p>Which statement is true for DNA replication?</p> <p>(A) Adenine pairs with guanine. (B) The process occurs during metaphase I. (C) DNA polymerase unwinds the double helix. (D) New strands are synthesised in the 5' to 3' direction.</p>
--	---

2023  
Paper 1  
Section 1  
Question 8

DNA, genes  
and the  
continuity of  
life

The diagram shows a human karyotype and a list of genetic conditions.

Genetic condition	Common name
Monosomy X	Turner syndrome
Monosomy 5	Cri du chat syndrome
Trisomy 18	Edwards syndrome
Trisomy 21	Down syndrome

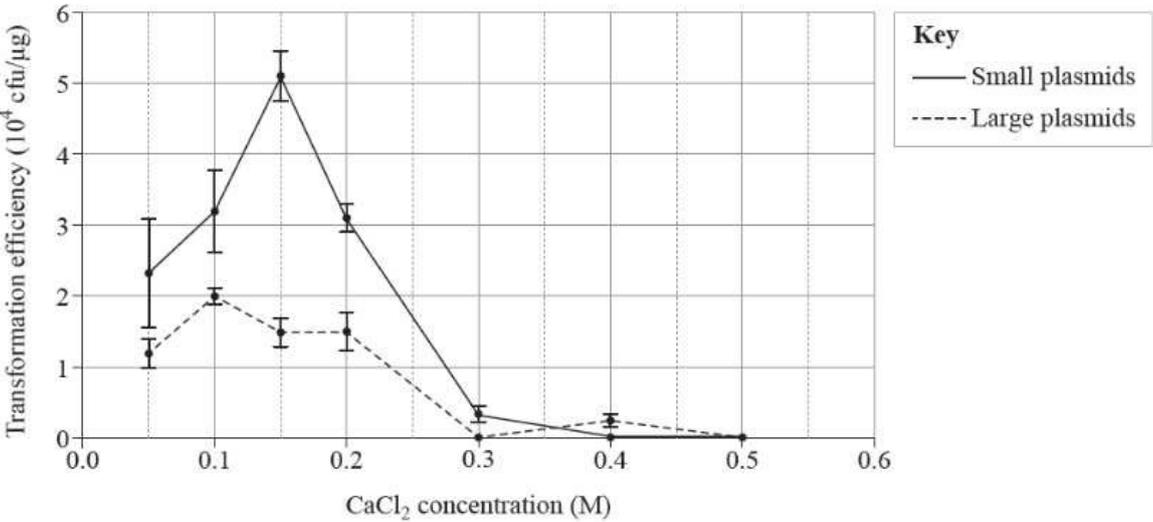

Which genetic condition is indicated in the karyotype?

- (A) Turner syndrome
- (B) Cri du chat syndrome
- (C) Edwards syndrome
- (D) Down syndrome

<b>2023</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 11</b>  <b>DNA, genes and the continuity of life</b>	Restriction enzymes  (A) join DNA into a single strand. (B) cut DNA at specific locations. (C) add nucleotides to a growing DNA strand. (D) assist in the amplification of recombinant DNA.
---	--

<b>2023</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 16</b>  <b>DNA, genes and the continuity of life</b>	<p>The diagram shows a section of DNA.</p> <div style="text-align: center;">  <p style="margin-left: 100px;">DNA</p> </div> <div style="text-align: center; border: 1px solid black; padding: 5px; width: fit-content; margin: 10px auto;"> <b>Key</b>  <input type="checkbox"/> Introns  <input checked="" type="checkbox"/> Exons     </div> <p>Immediately following transcription and RNA splicing, the product would most closely resemble</p> <p>(A) mRNA: </p> <p>(B) tRNA: </p> <p>(C) mRNA: </p> <p>(D) tRNA: </p>
---	--

<b>2023</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 17</b>  <b>DNA, genes and the continuity of life</b>	What is the most likely outcome of a homeobox (HOX) gene mutation?  (A) slower growth rate (B) body appendages in the incorrect location (C) failure of sex characteristics to fully develop (D) impaired ability of red blood cells to carry oxygen
---	---

<p><b>2023</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 18</b></p> <p><b>DNA, genes and the continuity of life</b></p>	<p>Calcium chloride (<math>\text{CaCl}_2</math>) is a chemical used in bacterial transformation. An experiment was conducted to determine how the concentration of calcium chloride affects the transformation efficiency of large and small plasmids. Error bars show standard error.</p>  <p>The data suggests that</p> <p>(A) the optimal concentration for transforming small plasmids is 0.15 M.  (B) transformation efficiency is highest at concentrations greater than 0.1 M.  (C) large plasmids have higher transformation efficiency than small plasmids.  (D) there is less variation in transformation efficiency of small plasmids when concentration is less than 0.2 M.</p>
---	---

<p><b>2023</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 19</b></p> <p><b>DNA, genes and the continuity of life</b></p>	<p>Electrophoresis separates DNA fragments based on</p> <p>(A) size, with larger fragments travelling further through the gel.  (B) size, with smaller fragments travelling further through the gel.  (C) charge, with more positively charged fragments travelling further through the gel.  (D) charge, with more negatively charged fragments travelling further through the gel.</p>
---	--

<p><b>2022</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 1</b></p> <p><b>DNA, genes and the continuity of life</b></p>	<p>What is the molecular unit of heredity?</p> <p>(A) gene  (B) genome  (C) nucleotide  (D) chromosome</p>
--	--

<b>2022</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 2</b>  <b>DNA, genes and the continuity of life</b>	Which stage of making recombinant DNA requires DNA ligase?  (A) cutting (B) joining (C) isolation (D) transformation
--	---

<b>2022</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 6</b>  <b>DNA, genes and the continuity of life</b>	The role of helicase in DNA replication is to  (A) initiate the process by binding to recognition sites along the template strand. (B) add complementary bases to the template strand. (C) unwind and separate DNA strands. (D) join DNA strands together.
--	---

<b>2022</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 7</b>  <b>DNA, genes and the continuity of life</b>	What is used directly by plants for protein synthesis?  (A) nitrite, $\text{NO}_2^-$ (B) nitrate, $\text{NO}_3^-$ (C) ammonia, $\text{NH}_3$ (D) atmospheric nitrogen, $\text{N}_2$
--	--

<b>2022</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 9</b>  <b>DNA, genes and the continuity of life</b>	Polygenic inheritance involves multiple  (A) alleles for a single gene. (B) genes with the same alleles. (C) genes coding for a single characteristic. (D) characteristics resulting from a single gene.
--	---

<b>2022</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 13</b>  <b>DNA, genes and the continuity of life</b>	An error during DNA replication resulted in the following change to mRNA transcripts.  <table border="1" style="margin-left: auto; margin-right: auto;"> <tr> <td style="padding: 2px;">mRNA before</td> <td style="padding: 2px;">AUGAAGUUUGGCAUC ... (continued)</td> </tr> <tr> <td style="padding: 2px;">mRNA after</td> <td style="padding: 2px;">AUGAAGUUUGCAUCG ... (continued)</td> </tr> </table>  The DNA replication error most likely involved (A) deletion of cytosine. (B) insertion of guanine. (C) substitution of uracil with guanine. (D) substitution of guanine with cytosine.	mRNA before	AUGAAGUUUGGCAUC ... (continued)	mRNA after	AUGAAGUUUGCAUCG ... (continued)
mRNA before	AUGAAGUUUGGCAUC ... (continued)				
mRNA after	AUGAAGUUUGCAUCG ... (continued)				

<b>2022</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 14</b>  <b>DNA, genes and the continuity of life</b>	Prior to fertilisation, a secondary oocyte will arrest at which stage of meiosis?  (A) prophase I (B) prophase II (C) metaphase I (D) metaphase II
---	---

<p><b>2022</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 15</b></p> <p><b>DNA, genes and the continuity of life</b></p>	<p>The environment's influence on gene expression can be investigated by comparing the rate of concordance in monozygotic (identical) and dizygotic (non-identical) twins. Concordance occurs when both twins express a trait.</p> <p>Strong environmental influence is suspected when concordance is</p> <p>(A) higher in monozygotic twins. (B) only observed in dizygotic twins. (C) only observed in monozygotic twins. (D) similar in monozygotic and dizygotic twins.</p>
---	---

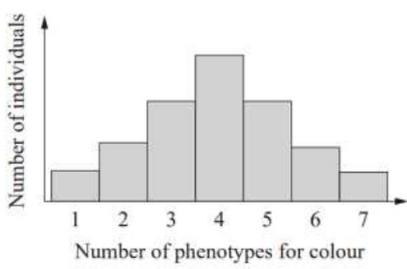

<p><b>2022</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 20</b></p> <p><b>DNA, genes and the continuity of life</b></p>	<p>A section of DNA is made up of two strands, I and II.</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th>Base</th> <th>Strand I composition</th> <th>Strand II composition</th> </tr> </thead> <tbody> <tr> <td>adenine</td> <td></td> <td></td> </tr> <tr> <td>cytosine</td> <td></td> <td>25%</td> </tr> <tr> <td>guanine</td> <td></td> <td>14%</td> </tr> <tr> <td>thymine</td> <td>29%</td> <td></td> </tr> </tbody> </table> <p>It can be inferred that</p> <p>(A) strand I contains 25% cytosine. (B) strand I contains 32% adenine. (C) strand II contains 29% thymine. **2021 Paper 1 Section 1 Question 4**  
**DNA, genes and the continuity of life**

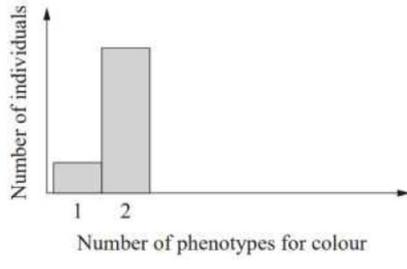

To demonstrate polygenic inheritance of colour in wheat, a cross was performed between two intermediate parents (AaBbCc × AaBbCc). Each dominant allele adds a 'unit' of colour to the phenotype.

Which graph would depict the number of individuals and number of phenotypes for the cross?

(A) 

(B) 

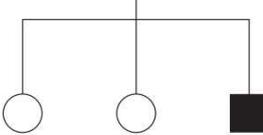

(C) 

(D) 

**2021 Paper 1 Section 1 Question 6**  
**DNA, genes and the continuity of life**

The pedigree traces a genetic disease across two generations.

Generation I: 

Generation II: 

**Key**

	Carrier (not affected)	Affected	Normal
Female			
Male			

The inheritance pattern of this disease can be classified as

(A) incomplete dominant.  
 (B) autosomal dominant.  
 (C) sex linked.  
 (D) polygenic.

**2021 Paper 1 Section 1 Question 12**  
**DNA, genes and the continuity of life**

The phenotypic expression of genes is regulated by

(A) transcription factors.  
 (B) random fertilisation.  
 (C) DNA polymerase.  
 (D) helicase.

<b>2021</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 13</b>  <b>DNA, genes and the continuity of life</b>	Which combination of processes demonstrates spermatogenesis?																
		<table border="1"> <thead> <tr> <th></th> <th>Where process occurs</th> <th>Outcome of process</th> </tr> </thead> <tbody> <tr> <td>(A)</td> <td>testes</td> <td>one functional gamete with 2–3 polar bodies</td> </tr> <tr> <td>(B)</td> <td>ovaries</td> <td>four functional haploid gametes</td> </tr> <tr> <td>(C)</td> <td>testes</td> <td>four functional haploid gametes</td> </tr> <tr> <td>(D)</td> <td>ovaries</td> <td>one functional gamete with 2–3 polar bodies</td> </tr> </tbody> </table>		Where process occurs	Outcome of process	(A)	testes	one functional gamete with 2–3 polar bodies	(B)	ovaries	four functional haploid gametes	(C)	testes	four functional haploid gametes	(D)	ovaries	one functional gamete with 2–3 polar bodies

<b>2020</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 3</b>  <b>DNA, genes and the continuity of life</b>	A genome is defined as  (A) the molecular unit of heredity. (B) all the genetic material in the chromosomes of an organism. (C) the sequence of triplets of DNA nucleotides that make up a gene. (D) the combination of alleles for a particular trait carried by an individual.
--	---

<b>2020</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 15</b>  <b>DNA, genes and the continuity of life</b>	In watermelon, skin colour is controlled by a single autosomal gene. The two phenotypic variants are green and striped. Two plants, one homozygous for the green alleles, and one homozygous for the striped alleles, were crossed.  The figure shows the phenotypic frequency for the initial ( $F_0$ ) generation and the subsequent ( $F_1$ ) generation.  A cross was then performed between members of the $F_1$ generation. What would be the expected frequency of striped watermelon in the next ( $F_2$ ) generation?  (A) 1.0 (B) 0.75 (C) 0.50 (D) 0.25
---	---

**2020 Paper 1 Section 1 Question 17**  
**DNA, genes and the continuity of life**

The table identifies the condition associated with a variety of ploidy changes.

Chromosome number ploidy	Condition name
Monosomy 5	Cri du chat syndrome
Trisomy 21	Down syndrome
Trisomy 23	Klinefelter syndrome
Monosomy 23	Turner syndrome

For a person with XXY sex chromosomes, which condition would they have?

(A) Cri du chat syndrome  
 (B) Down syndrome  
 (C) Klinefelter syndrome  
 (D) Turner syndrome

**2020 Paper 1 Section 1 Question 19**  
**DNA, genes and the continuity of life**

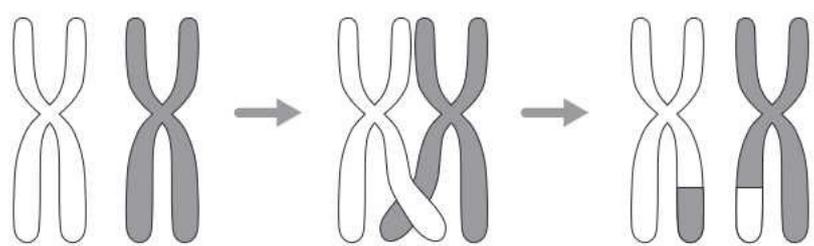

The table of data shows a comparison of amino acids sequences in the same section of haemoglobin molecules from a number of different species.

From the given information, which of the following species's haemoglobin protein is most similar to human haemoglobin protein?

Species	Sequence of amino acids							
Human	Lys	Glu	His	Ile	Val	Glu	Phe	Lys
(A)	Lys	Glu	His	Lys	Val	Met	Phe	Lys
(B)	Lys	Glu	Lys	Ile	Val	Glu	Phe	Lys
(C)	Lys	Asp	His	Leu	Val	Met	Phe	Lys
(D)	Lys	Val	His	Asn	Val	Glu	Phe	Lys

**DNA, genes and the continuity of life**

In blood group inheritance in humans, three alleles ( $i$ ,  $I^A$  and  $I^B$ ) determine blood type, which can be type O, A, B or AB.

It is known that:

- allele  $I^A$  produces type A and is co-dominant with allele  $I^B$ , which produces type B
- allele  $i$  produces type O
- alleles  $I^A$  and  $I^B$  are dominant over allele  $i$ .

A father who is heterozygous type A and a mother who is heterozygous type B have children. Predict the likely frequency of phenotypes for their offspring. Show your working. [3 marks]

and the  
continuity of  
life

Calcium chloride ( $\text{CaCl}_2$ ) is a chemical used in bacterial transformation. An experiment was conducted to determine how the concentration of calcium chloride affects the transformation efficiency of large and small plasmids. Error bars show standard error.

The data suggests that

- (A) the optimal concentration for transforming small plasmids is 0.15 M.
- (B) transformation efficiency is highest at concentrations greater than 0.1 M.
- (C) large plasmids have higher transformation efficiency than small plasmids.
- (D) there is less variation in transformation efficiency of small plasmids when concentration is less than 0.2 M.

Answer is A.

**2023  
Paper 1  
Section 2  
Question 24**

**DNA, genes  
and the  
continuity of  
life**

The frequency of a new allele was monitored in a population of insects over an 18-year period.

a) Infer if the new allele is advantageous or detrimental in this environment. Justify your response using evidence from the graph. [2 marks]

Sample response	The response
<p>Advantageous.</p> <p>There was a rapid increase in the frequency of the new allele between 2004 and 2008 (0–84%). The frequency then continued to increase until 2022, when approximately 97% of the population had the allele. This indicates positive selection for the allele has occurred, suggesting the trait is advantageous.</p>	<ul style="list-style-type: none"> <li>• infers the allele is advantageous [1 mark]</li> <li>• justifies response using evidence from the graph [1 mark]</li> </ul>

b) Explain how mutations can contribute to microevolutionary change in populations that reproduce sexually. [3 marks]

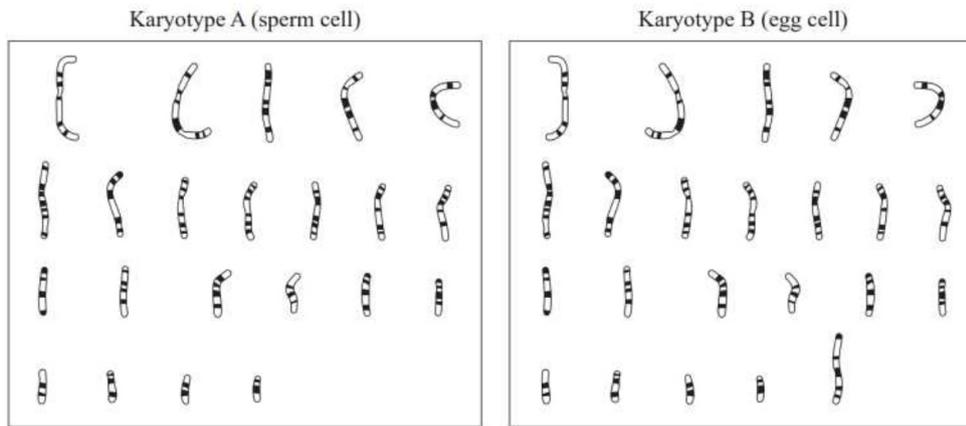

Sample response	The response
<p>If mutations occur in coding regions of DNA, they may create new alleles. If new alleles occur in sex cells, they can be passed to the next generation and may become more common in the population (particularly if they're advantageous), causing changes to allele frequencies.</p>	<ul style="list-style-type: none"> <li>• explains that mutations can create new alleles [1 mark]</li> <li>• recognises the mutation must occur in sex cells [1 mark]</li> <li>• explains how mutations contribute to microevolutionary change [1 mark]</li> </ul>

<p><b>2023</b> <b>Paper 1</b> <b>Section 2</b> <b>Question 27</b></p> <p><b>DNA, genes and the continuity of life</b></p>	<p>Clownfish have 24 pairs of chromosomes and reproduce via external fertilisation, with gametes initially created through meiosis. Females lay up to 1500 eggs and then males swim over the eggs and fertilise them.</p> <p>Explain how the processes of independent assortment and random fertilisation create variation in the genotypes of clownfish offspring. [3 marks]</p>	
	<p><b>Sample response</b></p>	<p><b>The response</b></p>
	<p>When homologous chromosomes pair up at metaphase 1 of meiosis, the orientation of maternal and paternal chromosomes is random, so each daughter cell (gamete) has a 50% chance of receiving the maternal homologue and a 50% chance of receiving the paternal homologue. This leads to <math>2^{24}</math> possible chromosome combinations for each egg and sperm.</p> <p>In addition to this, any of the millions of sperm created by each male fish could fertilise an egg. This leads to a high number of possible chromosome combinations for the offspring, even before crossing over is considered.</p>	<ul style="list-style-type: none"> <li>• explains <ul style="list-style-type: none"> <li>– the process of independent assortment [1 mark]</li> <li>– the process of random fertilisation [1 mark]</li> <li>– how independent assortment and random fertilisation contribute to genetic variation [1 mark]</li> </ul> </li> </ul>

2022  
Paper 1  
Section 2  
Question 26

DNA, genes  
and the  
continuity of  
life

Karyotypes for two human gametes are shown.

a) Identify which cell exhibits aneuploidy. Refer to evidence from the karyotype. [1 mark]

Sample Response	The response
The sperm cell is missing a sex chromosome.	<ul style="list-style-type: none"> <li>identifies the sperm cell is missing a chromosome [1 mark]</li> </ul>

b) Explain how this chromosome abnormality may have occurred. [2 marks]

Sample Response	The response
The abnormality may have occurred due to nondisjunction during meiosis, where the sex chromosomes failed to separate at anaphase and ended up in the same daughter cell. This results in the daughter cells (gametes) containing either two copies of the sex chromosome/s or no copies, as is the case for karyotype A.	<ul style="list-style-type: none"> <li>identifies the abnormality may be due to nondisjunction [1 mark]</li> <li>explains that non-disjunction occurs when chromosomes fail to separate during meiosis [1 mark]</li> </ul>

This table lists some genetic conditions resulting from chromosomal abnormalities.

Genetic condition	Common name
Monosomy 5	Cri du chat syndrome
Monosomy X	Turner syndrome
Trisomy 13	Patau syndrome
Trisomy 18	Edwards syndrome
Trisomy X	Triple X syndrome

c) Predict which genetic condition would occur if the two gametes produced a zygote. [1 mark]

Sample Response	The response
Turner syndrome.	<ul style="list-style-type: none"> <li>predicts Turner syndrome [1 mark]</li> </ul>

<b>2022</b> <b>Paper 1</b> <b>Section 2</b> <b>Question 27</b>  <b>DNA, genes and the continuity of life</b>	Explain the purpose of gel electrophoresis in DNA profiling. [2 marks]	
	<b>Sample Response</b>	<b>The response</b>
	Gel electrophoresis separates DNA segments based on size to produce characteristic banding patterns.	<ul style="list-style-type: none"> <li>identifies that gel electrophoresis is used to separate DNA fragments based on size [1 mark]</li> <li>explains that this produces characteristic banding patterns [1 mark]</li> </ul>

<b>2021</b> <b>Paper 1</b> <b>Section 2</b> <b>Question 25</b>  <b>DNA, genes and the continuity of life</b>	In blood group inheritance in humans, three alleles (i, I <sup>A</sup> and I <sup>B</sup> ) determine blood type, which can be type O, A, B or AB.  It is known that: <ul style="list-style-type: none"> <li>allele I<sup>A</sup> produces type A and is co-dominant with allele I<sup>B</sup>, which produces type B</li> <li>allele i produces type O</li> <li>alleles I<sup>A</sup> and I<sup>B</sup> are dominant over allele i.</li> </ul> A father who is heterozygous type A and a mother who is heterozygous type B have children. Predict the likely frequency of phenotypes for their offspring. Show your working. [3 marks]										
	<b>Sample Response</b>	<b>The response</b>									
	The genotypes of the parents are I <sup>A</sup> i and I <sup>B</sup> i  Potential crosses <table border="1" style="margin-left: 20px;"> <tr> <td></td> <td>I<sup>A</sup></td> <td>i</td> </tr> <tr> <td>I<sup>B</sup></td> <td>I<sup>A</sup>I<sup>B</sup></td> <td>I<sup>B</sup>i</td> </tr> <tr> <td>i</td> <td>I<sup>A</sup>i</td> <td>ii</td> </tr> </table> $\frac{1}{4}$ type AB, $\frac{1}{4}$ type A, $\frac{1}{4}$ type B, $\frac{1}{4}$ type O		I <sup>A</sup>	i	I <sup>B</sup>	I <sup>A</sup> I <sup>B</sup>	I <sup>B</sup> i	i	I <sup>A</sup> i	ii	<ul style="list-style-type: none"> <li>identifies parents as IAi and IBi [1 mark]</li> <li>shows appropriate working [1 mark]</li> <li>states a consequentially correct frequency for each blood type [1 mark]</li> </ul>
	I <sup>A</sup>	i									
I <sup>B</sup>	I <sup>A</sup> I <sup>B</sup>	I <sup>B</sup> i									
i	I <sup>A</sup> i	ii									

<b>2021</b> <b>Paper 1</b> <b>Section 2</b> <b>Question 26</b>  <b>DNA, genes and the continuity of life</b>	a) State the three components of a DNA nucleotide. [1 mark]	
	<b>Sample Response</b>	<b>The response</b>
	Phosphate, deoxyribose sugar and a nitrogenous base.	states phosphate, sugar and a base [1 mark]
	b) Describe the steps involved in DNA profiling. [3 marks]	
	<b>Sample Response</b>	<b>The response</b>
	DNA samples are taken from two or more individuals and short sequences/STRs are identified and separated. The short fragments of DNA are then amplified using polymerase chain reaction (PCR). Results are compared by gel electrophoresis, so DNA similarities and differences between the samples and/or a known DNA profile can be determined.	<ul style="list-style-type: none"> <li>describes           <ul style="list-style-type: none"> <li>one step [1 mark]</li> <li>a second step [1 mark]</li> <li>a third step [1 mark]</li> </ul> </li> </ul>

<b>2020</b> <b>Paper 1</b> <b>Section 2</b> <b>Question 24</b>  <b>DNA, genes</b> <b>and the</b> <b>continuity of</b> <b>life</b>	a) Describe what is meant by the genotype of an organism. [1 mark]	
	<b>Sample Response</b>	<b>The response</b>
	Genotype refers to the combination of alleles that an organism has.	<ul style="list-style-type: none"> <li>states combination of alleles [1 mark]</li> </ul>
	b) Inherited mutations can affect the genotype of offspring. Describe how this occurs. [2 marks]	
	<b>Sample Response</b>	<b>The response</b>
	<p>The parent of the offspring would have a mutation that is inheritable (in sex organs) and creates a new allele (variation of a gene).</p> <p>The genotype of an offspring may then be affected as it would contain new alleles if the mutated gene from an egg or sperm is present in the zygote at fertilisation.</p> <p>This will then affect the genotype of the offspring.</p>	<ul style="list-style-type: none"> <li>states a description of the mutation being a new allele of a gene [1 mark]</li> <li>states genotype contains new alleles if/when inherited [1 mark]</li> </ul>

**Marking Guide – Paper 2 Section 1**

<p><b>2024 Paper 2 Section 1 Question 4</b></p> <p><b>DNA, genes and the continuity of life</b></p>	a) Describe the roles of helicase and DNA polymerase in DNA replication. [2 marks]	
	<b>Sample response</b>	<b>The response</b>
	Helicase unwinds the double helix and separates the strands. Polymerase adds nucleotides to the new strand.	<ul style="list-style-type: none"> <li>describes the role of helicase <b>[1 mark]</b></li> <li>describes the role of DNA polymerase <b>[1 mark]</b></li> </ul>
	b) Explain two ways the structure of DNA allows helicase and DNA polymerase to carry out their roles. [2 marks]	
	<b>Sample response</b>	<b>The response</b>
	The weak nature of hydrogen bonds makes it easy for helicase to separate strands. Complementary base pairing allows DNA polymerase to be guided by the template strand.	<ul style="list-style-type: none"> <li>explains one way the structure of DNA aids replication <b>[1 mark]</b></li> <li>explains a second way the structure of DNA aids replication <b>[1 mark]</b></li> </ul>
c) Explain how errors during DNA replication can lead to point and frameshift mutations. [2 marks]		
<b>Sample response</b>	<b>The response</b>	
Mutations occur when DNA polymerase makes an error by inserting, removing or adding an incorrect nucleotide. Substitution reactions involve A, T, C or G being swapped for a different nucleotide, and result in point mutations. Because of the way that codons work, these mutations will only affect one amino acid. Additions or deletions cause frameshift mutations, where all codons after the mutation will be affected.	<ul style="list-style-type: none"> <li>explains how errors in DNA replication cause point mutations <b>[1 mark]</b></li> <li>explains how errors in DNA replication cause frameshift mutations <b>[1 mark]</b></li> </ul>	

2024  
Paper 2  
Section 1  
Question 6

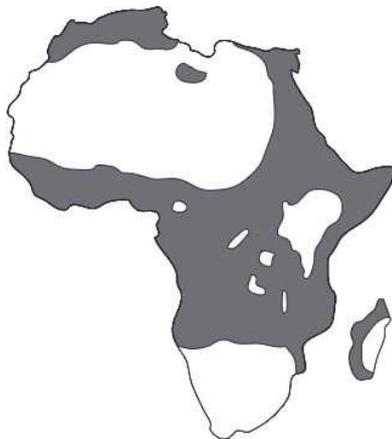

DNA, genes  
and the  
continuity  
of life

Sickle-cell anaemia is an autosomal recessive condition that reduces the ability of red blood cells to carry oxygen. This is usually considered detrimental; however, individuals who are heterozygous for the trait may be less prone to the infectious disease malaria.

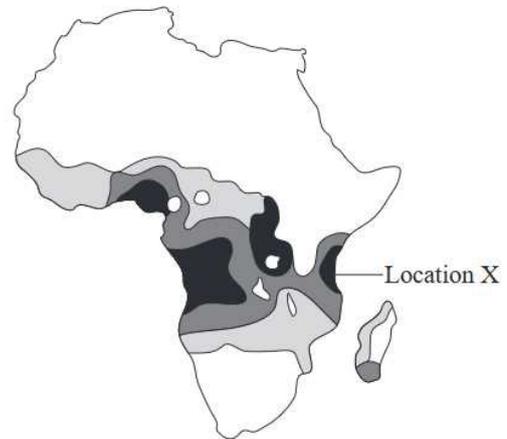

These maps show the distribution of malaria and frequency of the sickle-cell anaemia allele in Africa

Not to scale

Malaria distribution

Frequency of sickle-cell anaemia allele

This table shows the genotypes of individuals living at location X.

Genotype	Number of individuals
AA	830
Aa	540
aa	23

a) Calculate the frequency of the recessive allele, a, in the population at location X.  
Show your working. [2 marks]

Sample response	The response
$\text{Frequency (a)} = \frac{(2 \times 23) + 540}{2 \times (830 + 540 + 23)}$ $= 0.21$	<ul style="list-style-type: none"> <li>calculates frequency of allele a [1 mark]</li> <li>provides appropriate working [1 mark]</li> </ul>

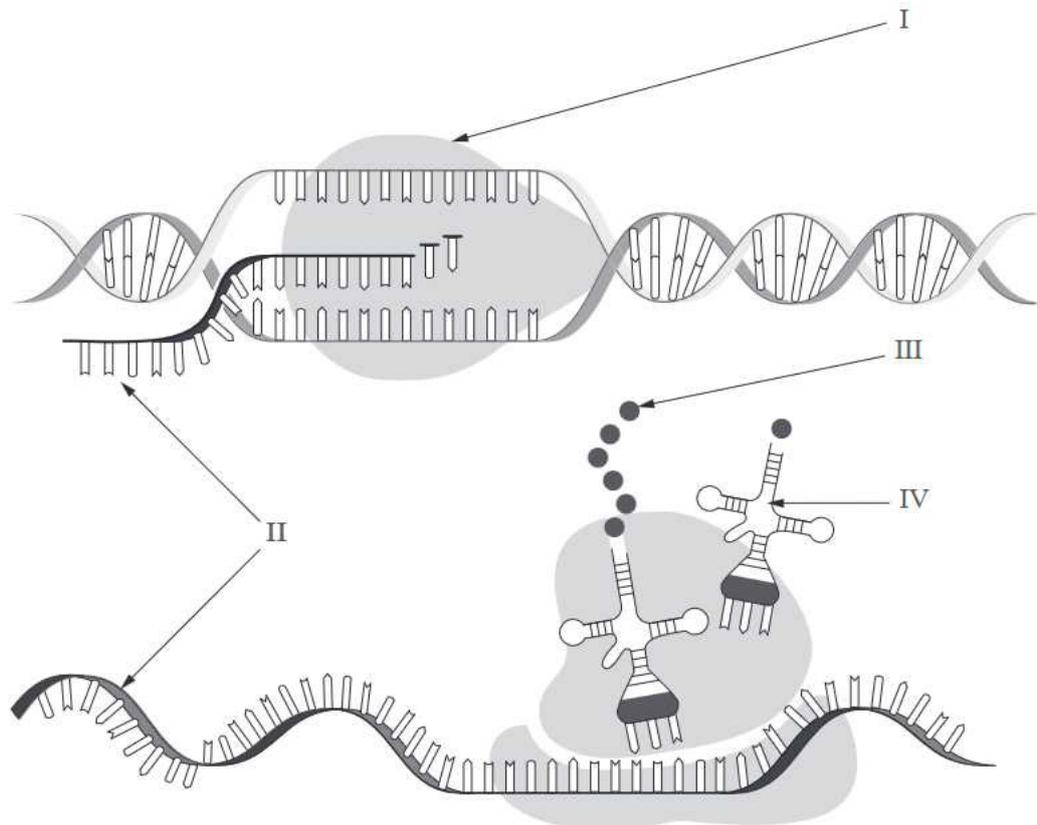

b) Identify evidence for the sickle-cell anaemia allele being advantageous for individuals living where malaria is prevalent. Explain your reasoning. [2 marks]

Sample response	The response
<p>Frequencies of the sickle-cell anaemia allele are high (1–20%) in the middle of the continent, where malaria is present, but low (&lt;1%) in other areas. This suggests positive selection for the allele has occurred in these areas, causing it to become more prevalent. This is characteristic of an allele that is advantageous.</p>	<ul style="list-style-type: none"> <li>identifies appropriate evidence [1 mark]</li> <li>explains their reasoning [1 mark]</li> </ul>

2024  
Paper 2  
Section 1  
Question 9

DNA, genes  
and the  
continuity of  
life

The diagram shows key stages of gene expression

a) Identify structures I, II and III. [3 marks]

Sample response	The response
I. RNA polymerase II. mRNA III. polypeptide	<ul style="list-style-type: none"> <li>identifies I as RNA polymerase [1 mark]</li> <li>identifies II as mRNA [1 mark]</li> <li>identifies III as polypeptide [1 mark]</li> </ul>

b) Describe the role of structure IV and explain how it carries out this function. [3 marks]

Sample response	The response
The role of tRNA is to transport amino acids from the cytoplasm to the ribosome in the order specified by the mRNA. Each tRNA carries a specific amino acid, based on its anticodon sequence. The anticodon recognises and binds to its complementary sequence on the mRNA molecule. This allows amino acids to be connected in the order specified by the mRNA sequence.	<ul style="list-style-type: none"> <li>describes <ul style="list-style-type: none"> <li>the role of tRNA [1 mark]</li> <li>the role of anticodons [1 mark]</li> <li>tRNA-amino acid specificity [1 mark]</li> </ul> </li> </ul>

c) Describe two ways gene expression is regulated. [2 marks]

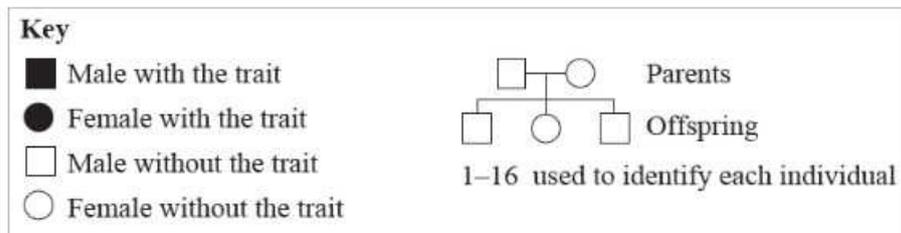

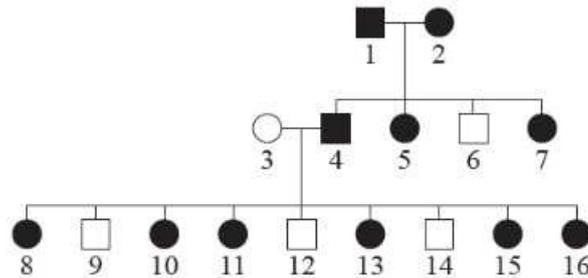

Sample response	The response
Transcription factors bind to sections of DNA near the gene being expressed and either promote or inhibit the binding of RNA polymerase. Epigenetic tags affect the degree of DNA coiling. Genes in sections of DNA that are tightly bound are usually not expressed because the enzymes involved in transcription can't access them.	<ul style="list-style-type: none"> <li>describes one way gene expression is regulated [1 mark]</li> <li>describes a second way gene expression is regulated [1 mark]</li> </ul>

d) Explain two reasons why genetic mutations do not always affect the phenotype of an individual. [2 marks]

Sample response	The response
Mutations may occur in non-coding sections of DNA (introns), meaning the resulting polypeptide will not be affected. Point mutations may not change the amino acid the triplet codes for, meaning the resulting polypeptide is unaffected (silent mutation).	<ul style="list-style-type: none"> <li>provides one reason [1 mark]</li> <li>provides a second reason [1 mark]</li> </ul>

2023  
Paper 2  
Section 1  
Question 3  
  
DNA, genes  
and the  
continuity of  
life

The chart shows the inheritance pattern of a trait, which is thought to be sex-linked dominant.

a) Identify how many offspring of individuals 1 and 2 have the trait. [1 mark]

Sample response	The response
3	<ul style="list-style-type: none"> <li>states 3 [1 mark]</li> </ul>

b) Identify evidence to support the conclusion that the trait is sex-linked dominant. Justify your response using a Punnett square. [4 marks]

Sample response	The response									
<p>Individual 4 has passed the trait on to all his daughters (who would inherit his X chromosome) but none of his sons (who would inherit his Y chromosome).</p> <table border="1"> <tr> <td></td> <td>X<sup>A</sup></td> <td>Y</td> </tr> <tr> <td>X<sup>a</sup></td> <td>X<sup>A</sup>X<sup>a</sup></td> <td>X<sup>a</sup>Y</td> </tr> <tr> <td>X<sup>a</sup></td> <td>X<sup>A</sup>X<sup>a</sup></td> <td>X<sup>a</sup>Y</td> </tr> </table> <p>This shows that if an affected male (X<sup>A</sup>Y) mates with an unaffected female (X<sup>a</sup>X<sup>a</sup>), all of their daughters will be affected, but none of their sons.</p> <p>This matches the chart, as individual 4 has six daughters with the trait, but none of his three sons have it.</p>		X <sup>A</sup>	Y	X <sup>a</sup>	X <sup>A</sup> X <sup>a</sup>	X <sup>a</sup> Y	X <sup>a</sup>	X <sup>A</sup> X <sup>a</sup>	X <sup>a</sup> Y	<ul style="list-style-type: none"> <li>identifies appropriate evidence from the chart [1 mark]</li> <li>identifies appropriate genotypes for the Punnett square [1 mark]</li> <li>constructs a Punnett square [1 mark]</li> <li>uses the Punnett square to determine expected frequencies for offspring phenotypes [1 mark]</li> </ul>
	X <sup>A</sup>	Y								
X <sup>a</sup>	X <sup>A</sup> X <sup>a</sup>	X <sup>a</sup> Y								
X <sup>a</sup>	X <sup>A</sup> X <sup>a</sup>	X <sup>a</sup> Y								

c) Infer the genotype of individual 6. Explain your reasoning. [2 marks]

Sample response	The response
X <sup>a</sup> Y Individual 6 is a male without the trait, so he must have inherited a recessive allele.	<ul style="list-style-type: none"> <li>infers X<sup>a</sup>Y [1 mark]</li> <li>provides appropriate reasoning [1 mark]</li> </ul>

<b>2023</b> <b>Paper 2</b> <b>Section 1</b> <b>Question 6</b>  <b>DNA, genes and the continuity of life</b>	Explain how twin studies can be used to investigate the effect of the environment on gene expression. [3 marks]			
	<table border="1"> <thead> <tr> <th>Sample response</th> <th>The response</th> </tr> </thead> <tbody> <tr> <td>Twin studies involve collecting data on the rate of concordance/discordance in monozygotic twin pairs. Because identical twins form from a single egg, they share the same DNA, so any differences in phenotype can be attributed to the environment. Approximately 25 red-eyed females and 25 white-eyed males.			<ul style="list-style-type: none"> <li>predicts 25 females with red eyes [1 mark]</li> <li>predicts 25 males with white eyes [1 mark]</li> </ul>															

<b>2021 Paper 2 Section 1 Question 2</b>  <b>DNA, genes and the continuity of life</b>	a) Explain the difference between exons and introns. [2 marks]	
	<b>Sample Response</b>	<b>The response</b>
	Exons are sequences of coding DNA, which is transcribed into mRNA and then translated into proteins. Introns are sequences of non-coding DNA and have a variety of other functions. They are spliced out of the mRNA prior to translation.	<ul style="list-style-type: none"> <li>• states that exons are coding DNA and introns are non-coding DNA [1 mark]</li> <li>• explains that exons are transcribed into mRNA and then translated into proteins, whereas introns are spliced out of mRNA and have other functions [1 mark]</li> </ul>
b) State a function of telomeres. [1 mark]		
<b>Sample Response</b>	<b>The response</b>	
Telomeres protect the ends of chromosomes from being degraded, prolonging their life.	<ul style="list-style-type: none"> <li>• states a function of telomeres [1 mark]</li> </ul>	

<b>2021 Paper 2 Section 1 Question 4</b>  <b>DNA, genes and the continuity of life</b>	Explain the purpose of the polymerase chain reaction (PCR) process and provide an example of its application. [2 marks]	
	<b>Sample Response</b>	<b>The response</b>
	<p>Polymerase chain reaction is used to amplify (i.e. make many copies) of a DNA template because usually only a small amount of DNA is available for analysis.</p> <p>For example, crime scene DNA is sometimes found only at trace levels. PCR amplifies this small amount to allow analysis to be carried out.</p>	<ul style="list-style-type: none"> <li>• explains purpose of PCR as amplifying a DNA sample for further analysis [1 mark]</li> <li>• provides an example [1 mark]</li> </ul>

2021  
Paper 2  
Section 1  
Question 5

DNA, genes  
and the  
continuity of  
life

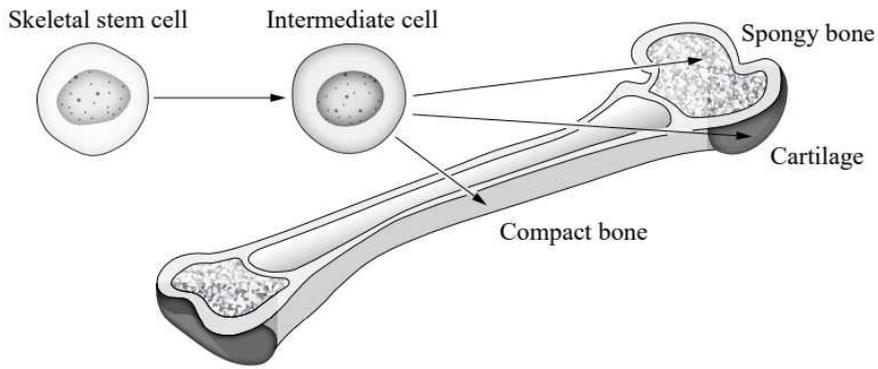

Meiosis ensures that a wide range of genetic combinations occurs during the formation of gametes. The diagrams show two processes that occur during meiosis.

Describe the two processes shown in the diagrams and how they contribute to genetic variation in gametes. [6 marks]

Sample Response	The response
Crossing over: When segments of maternal and paternal chromosomes are exchanged during the process of meiosis, resulting in chromosomes containing DNA from each parent — new genetic combinations are produced at the chromosome level.	<ul style="list-style-type: none"> <li>• for crossing over</li> <li>- provides the name of the process [1 mark]</li> <li>- describes the process [1 mark]</li> <li>- states how the process contributes to genetic variation in gametes [1 mark]</li> </ul>
Independent assortment: Maternal and paternal chromosomes do not separate together; instead, each haploid gamete cell will contain a mixture of chromosomes from each parent, providing new genetic combinations.	<ul style="list-style-type: none"> <li>• for independent assortment</li> <li>- provides the name of the process [1 mark]</li> <li>- describes the process [1 mark]</li> <li>- states how the process contributes to genetic variation in gametes [1 mark]</li> </ul>

<b>2021</b> <b>Paper 2</b> <b>Section 1</b> <b>Question 10</b>  <b>DNA, genes and the continuity of life</b>	Describe three ways DNA occurs in cells. [3 marks]				
	<table border="1"> <thead> <tr> <th>Sample Response</th> <th>The response</th> </tr> </thead> <tbody> <tr> <td>In eukaryotes, DNA occurs bound to histone proteins in chromosomes in the nucleus of eukaryotes or as unbound circular DNA in the mitochondria. **2022 Paper 1 Section 1 Question 4**

**Continuity of life on Earth**

The graph shows the effect of a selection pressure on a hypothetical population.

Key

- Before the selection pressure
- 20 generations later

Which mode of phenotypic selection corresponds with the data?

(A) negative  
(B) disruptive  
(C) stabilising  
(D) directional

**2022 Paper 1 Section 1 Question 10**

**Continuity of life on Earth**

Wings in birds, bats and pterosaurs are phenotypically similar, though they belong to different families and do not have a common ancestor with the trait. While the general morphology is similar, the structure and organisation of each wing is different.

This is an example of

(A) coevolution.  
(B) parallel evolution.  
(C) divergent evolution.  
(D) convergent evolution.

**2022 Paper 1 Section 1 Question 11**

**Continuity of life on Earth**

Evolutionary relationships were investigated by sequencing a section of protein from five different species. Each letter represents an amino acid.

<b>Species I</b>	D	E	V	G	W	E	A	L	G	R	L	V	S
<b>Species II</b>	D	E	V	G	W	E	G	L	G	R	A	V	S
<b>Species III</b>	D	E	A	G	S	E	G	L	A	R	L	E	S
<b>Species IV</b>	D	E	V	G	S	E	G	L	G	R	L	E	S
<b>Species V</b>	D	E	V	G	W	E	A	L	A	R	L	V	S

It can be inferred that Species I is most closely related to

(A) Species II.  
(B) Species III.  
(C) Species IV.  
(D) Species V.

**2022 Paper 1 Section 1 Question 12**

**Continuity of life on Earth**

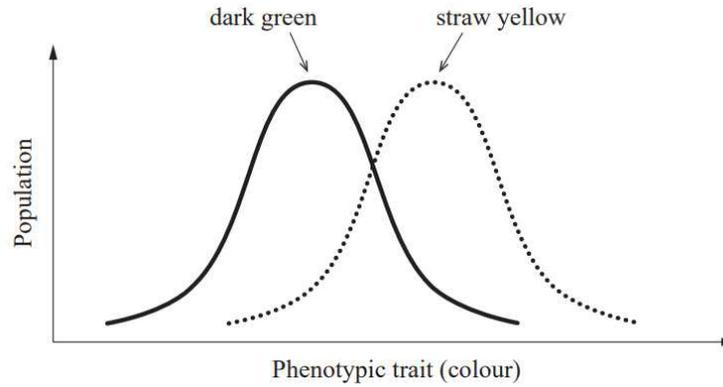

Speciation occurs when

(A) the gene pool of an existing species becomes too small to support a viable population.  
(B) selection pressures cause significant changes to the allele frequencies of a population.  
(C) genetic drift is no longer occurring within populations.  
(D) gene flow is no longer occurring between populations.

2021  
Paper 1  
Section 1  
Question 7

Continuity of  
life on Earth

In a long-term study of grasshopper colour in a grassland ecosystem, it was found that the most abundant phenotype changed from dark green to straw yellow.

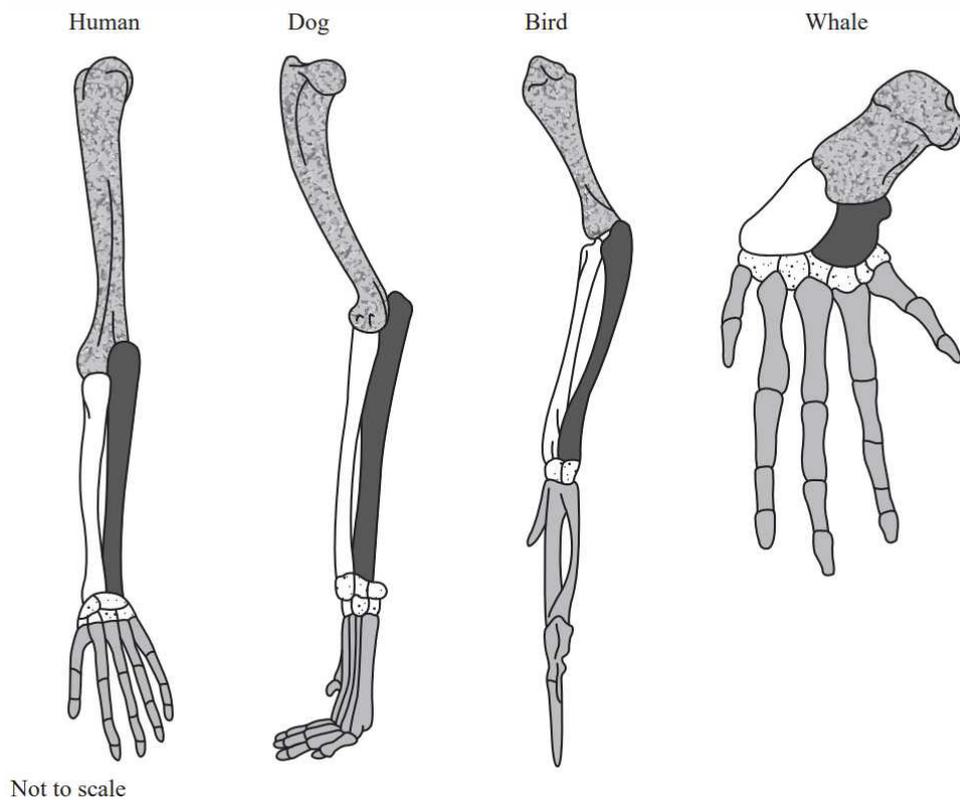

This change in the phenotype is an example of

- (A) diversifying selection.
- (B) directional selection.
- (C) stabilising selection.
- (D) disruptive selection.

2021  
Paper 1  
Section 1  
Question 10

Continuity  
of life on  
Earth

The forelimbs of humans, dogs, birds and whales have a very similar pattern of bones.

The similarity of these structures is best explained by which pattern of evolution?

- (A) convergent evolution
- (B) divergent evolution
- (C) parallel evolution
- (D) coevolution

<p><b>2021</b> <b>Paper 1</b> <b>Section 1</b> <b>Question 16</b></p> <p><b>Continuity of life on Earth</b></p>	<p>A small group of dingoes migrated to a new area and established a population. After several generations, the new population showed a different genetic composition from the original population. This is an example of</p> <p>(A) microevolution and gene flow. (B) macroevolution and gene flow. (C) microevolution and genetic drift. (D) macroevolution and genetic drift.</p>
---	--

Question 9**  
**Continuity  
of life on  
Earth**

A computer simulation was used to observe genotypic changes in the gene pool of 20 randomly selected rabbits. The simulation was set with these parameters:

- each rabbit's coat colour was either black or white
- black alleles were dominant; white alleles were recessive
- the number of rabbits was constant in each generation and breeding was random throughout the population
- an environmental factor was chosen in the simulation to provide selection pressure.

The table shows the results of the simulation at the start and after 20 generations.

Initial population genotypes	Population genotypes after 20 generations
BB BB BB BB BB BB	BB BB
Bb	Bb Bb Bb Bb Bb Bb Bb Bb
bb bb bb	bb bb bb bb bb bb bb bb bb

Contrast the initial allele frequency with the allele frequency after 20 generations to draw a conclusion about the effect of the selection pressure on the rabbit population.

Question 22**

**Continuity of life on Earth**

The graph shows the effect of a selection pressure on the body length of a fish population

a) Determine which type of phenotypic selection has occurred. [1 mark]

Sample response	The response
Disruptive selection	<ul style="list-style-type: none"> <li>determines disruptive selection [1 mark]</li> </ul>

b) Use the principles of natural selection to explain the observed trends. [3 marks]

Sample response	The response
The selection pressure provided a selective advantage to fish with body lengths around 13 cm and 21 cm. These fish had an increased chance of surviving to reproduce and pass on the trait, leading to an increase in these phenotypes from ~8% and ~4% before the selection pressure to ~16% after. Fish with intermediate phenotypes (~15–18 cm) were selected against, causing their relative frequencies to decrease over time.	<ul style="list-style-type: none"> <li>explains the observed trends, referring to                             <ul style="list-style-type: none"> <li>phenotypic variation [1 mark]</li> <li>differential survival and reproduction [1 mark]</li> <li>change over time [1 mark]</li> </ul> </li> </ul>

**2022  
Paper 1  
Section 2  
Question 23**

**Continuity of life on Earth**

Compare microevolution and macroevolution. [3 marks]

Sample Response	The response
Both involve changes in allele frequencies, but in microevolution, this change occurs within a species, whereas for macroevolution, the change is at or above the species level. This means that in microevolution, the descendant is in the same taxonomic group as the ancestor, whereas in macroevolution, the descendant is in a different taxonomic group.	<ul style="list-style-type: none"> <li>provides a similarity [1 mark]</li> <li>provides a difference [1 mark]</li> <li>states the significance [1 mark]</li> </ul>

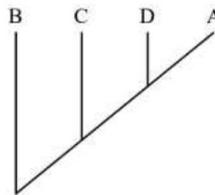

**2021  
Paper 1  
Section 2  
Question 27**

**Continuity of  
life on Earth**

The table shows the percentage sequence similarity for three different parts of a gene found in four different eukaryotic species. The data was obtained by comparing DNA from one member of each species to Species A.

From this data, a proposed phylogenetic tree was produced.

Species	Gene region 1	Gene region 2	Gene region 3
A	100%	100%	100%
B	98%	96%	82%
C	99%	92%	96%
D	99%	99%	92%

Determine whether the phylogenetic tree has been drawn correctly based on the DNA comparison. Explain your reasoning. [3 marks]

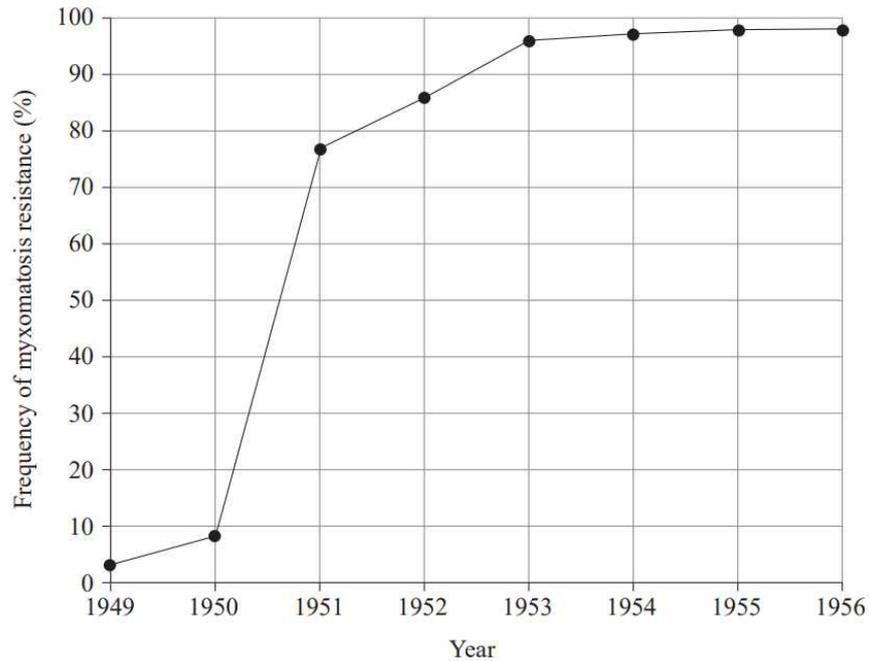

Sample Response	The response
The phylogenetic tree is correct. In order of percentage differences compared to A, D is 10% different across the three gene regions, C is 13% different and B is 24% different.	<ul style="list-style-type: none"> <li>• determines that the tree is correct [1 mark]</li> <li>• describes the order of percentage differences between species [1 mark]</li> <li>• provides relevant data from the table [1 mark]</li> </ul>

**2022  
Paper 1  
Section 2  
Question 28**

**Continuity of  
life on Earth**

In 1950, the myxoma virus was released into Australian pest rabbit populations to reduce their numbers. The resulting disease, myxomatosis, initially wiped out 95% of the rabbit population; however, it quickly became less effective as a population control measure.

This graph shows the frequency of myxomatosis resistance in Australia's rabbit population from 1949 to 1956.

Use evidence from the graph and the principles of natural selection to explain how myxomatosis became ineffective as a population control measure. [3 marks]

Sample Response	The response
<p>The introduction of the myxoma virus conferred a selective advantage on the myxomatosis-resistant phenotype. Myxomatosis-resistant rabbits had an increased chance of surviving to reproduce and pass on the trait. This led to an increase in the frequency of this phenotype in the population from approximately 9% in 1950 to approximately 96% in 1953. After 1953, most of the remaining rabbits possessed the myxomatosis-resistant phenotype, so the disease was no longer effective at reducing rabbit numbers.</p>	<ul style="list-style-type: none"> <li>• recognises that the myxomatosis-resistant phenotype provided a selective advantage [1 mark]</li> <li>• uses evidence from the graph to establish that this caused myxomatosis resistance to increase in the population [1 mark]</li> <li>• concludes that myxomatosis became less effective as the percentage of myxomatosis resistant rabbits increased [1 mark]</li> </ul>

Define microevolution. [1 mark]

Sample Response	The response
<p>Microevolution is the small-scale variation of allele frequencies within a species or population, in which the descendant is of the same taxonomic group as the ancestor.</p>	<ul style="list-style-type: none"> <li>• states small-scale variation of allele frequencies within a species or population, in which the descendant is of the same taxonomic group as the ancestor [1 mark]</li> </ul>

**2020  
Paper 1  
Section 2  
Question 27**

**Continuity of  
life on Earth**

In a freshwater lake in Africa, a species of crab and its snail prey species both exhibit specialisations that are unusual for freshwater species. The crabs possess strong claws with characteristics of marine crabs that crush and peel shells, and the snail prey have thick, strong shells that resist crushing.

a) Identify which pattern of evolution this example represents. [1 mark]

Sample Response	The response
Coevolution	• states coevolution [1 mark]

b) Describe how the two species may have evolved these characteristics. [3 marks]

Sample Response	The response
<p>The increased ability for crabs to crush shells acts as a selection pressure on the prey and the stronger shells on the snails acts as a selection pressure on the crabs.</p> <p>Within the crab population, some will have stronger claws and be more successful in preying on the snails, and within the snail population, some will have stronger shells and resist predation — these are both selection advantages.</p> <p>This means that the population will gain a higher proportion of the genes that lead to claw strength or shell strength and, therefore, the population gains phenotypic resistance.</p>	<ul style="list-style-type: none"> <li>• states the selection pressures [1 mark]</li> <li>• describes variation in claw strength and shell strength occurring in both populations [1 mark]</li> <li>• describes the individuals with the selection advantage surviving and passing on the genes/traits to the next generation [1 mark]</li> </ul>

**Marking Guide – Paper 2 Section 1**

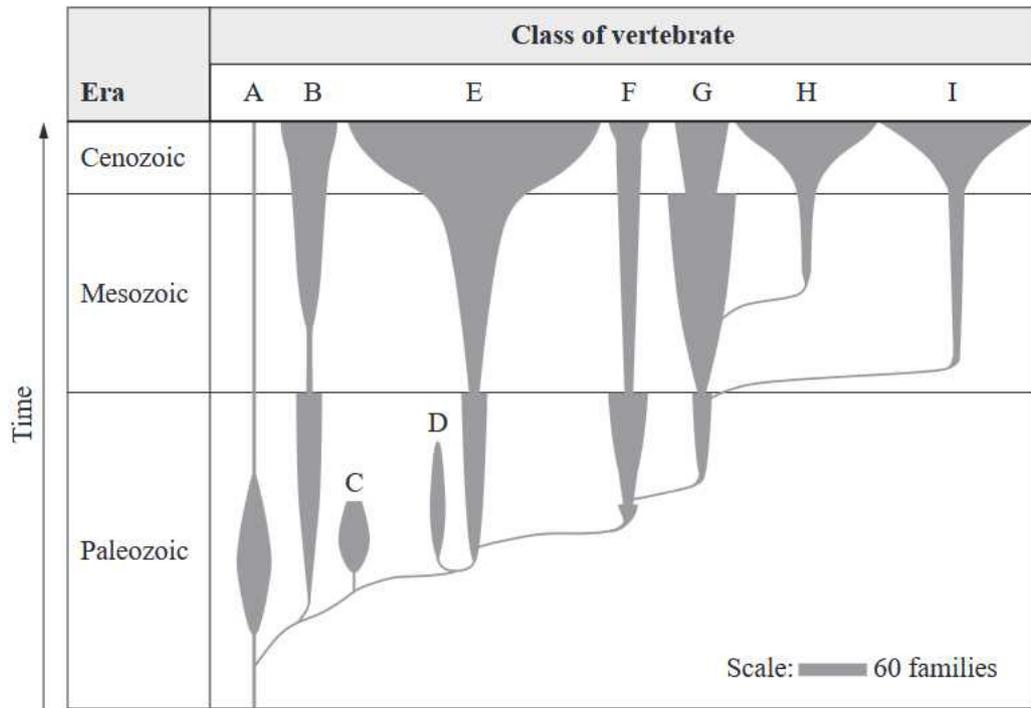

<p><b>2024 Paper 2 Section 1 Question 5</b></p> <p><b>Continuity of life on Earth</b></p>	a) Describe a population bottleneck	
	<b>Sample response</b>	<b>The response</b>
	A population bottleneck is an event that drastically reduces the size of a population.	<ul style="list-style-type: none"> <li>describes a population bottleneck <b>[1 mark]</b></li> </ul>
b) Explain why populations affected by bottlenecks face increased risk of extinction. [2 marks]		
	<b>Sample response</b>	<b>The response</b>
	A population bottleneck may lead to lower genetic variation because individuals who survive usually do so by chance. Allele frequencies of the remaining population may not reflect the original population, and some (potentially fitter) alleles may be lost altogether. Lower genetic diversity means a population is less likely to have favourable alleles that allow them to respond effectively to environmental changes, increasing the risk of extinction.	<ul style="list-style-type: none"> <li>recognises population bottlenecks reduce genetic diversity <b>[1 mark]</b></li> <li>explains why lower genetic diversity increases the risk of extinction <b>[1 mark]</b></li> </ul>

<p><b>2024 Paper 2 Section 1 Question 7</b></p> <p><b>Continuity of life on Earth</b></p>	a) Explain how habitat fragmentation can lead to speciation. [3 marks]	
	<b>Sample response</b>	<b>The response</b>
	Habitat fragmentation can lead to geographic isolation, where populations that were previously able to interbreed can no longer reach each other to do so. This disruption to gene flow can result in two populations evolving independently to the point that they are too genetically dissimilar to interbreed.	<ul style="list-style-type: none"> <li>recognises that habitat fragmentation can cause populations to become isolated <b>[1 mark]</b></li> <li>identifies that this disrupts gene flow <b>[1 mark]</b></li> <li>explains how disruption to gene flow can lead to speciation <b>[1 mark]</b></li> </ul>
b) Identify the type of speciation that occurs due to habitat fragmentation. [1 mark]

Question 10

Continuity  
of life on  
Earth

The chart shows the number of families in nine classes of vertebrate (A to I) over geological time.

a) Identify a trend in vertebrate biodiversity over time. Refer to data to support your response. [2 marks]

Sample response	The response
Vertebrate biodiversity has increased over geological time. While the number of different classes has remained about the same in each era (7), the number of families has gradually increased from ~110 at the end of the Palaeozoic era to ~220 at the end of the Mesozoic era and ~610 in the Cenozoic era.	<ul style="list-style-type: none"> <li>identifies an appropriate trend [1 mark]</li> <li>provides data to support response [1 mark]</li> </ul>

b) Identify which classes became extinct during this time and the era/s in which the extinctions occurred. [2 marks]

Sample response	The response
Classes C and D became extinct during the Palaeozoic era.	<ul style="list-style-type: none"> <li>identifies C and D [1 mark]</li> <li>identifies Palaeozoic era [1 mark]</li> </ul>

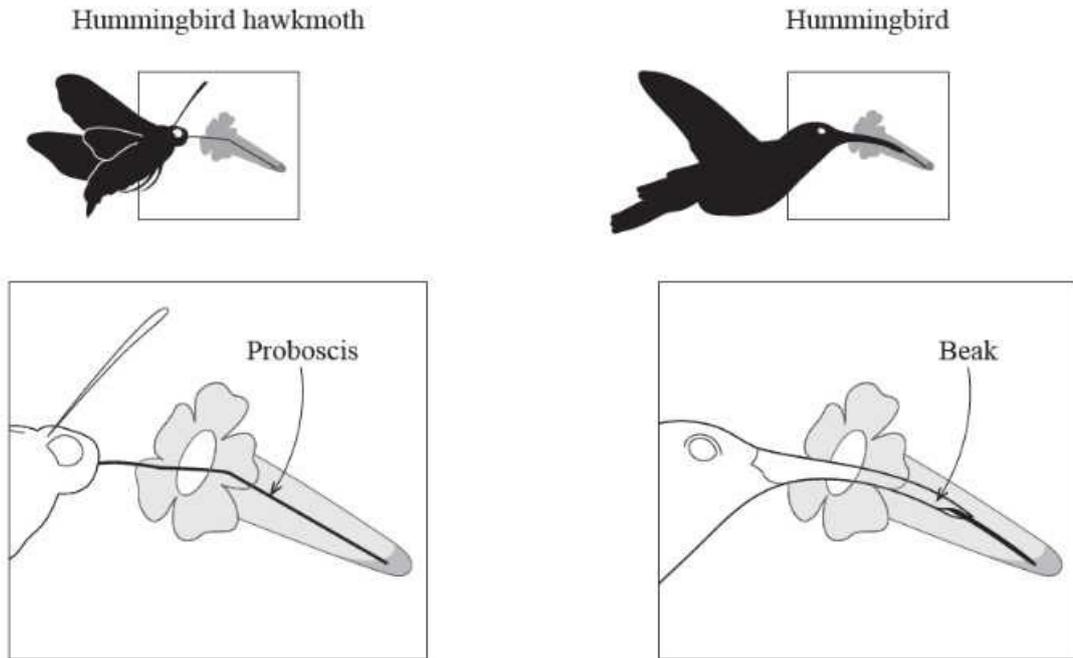

c) Which class had family extinctions at the boundary of the Mesozoic and Cenozoic eras? [1 mark]

Sample response	The response
Class G	<ul style="list-style-type: none"> <li>identifies G [1 mark]</li> </ul>

Question 4

Continuity  
of life on  
Earth

The hummingbird hawkmoth (phylum: *Arthropoda*) is named for its similarity to hummingbirds (phylum: Chordata). The two species have independently developed similar feeding structures, which they use to draw nectar from tube-shaped flowers. Both species help plants reproduce by distributing their pollen.

a) Identify the diversification pattern demonstrated by the hummingbird and the hummingbird hawkmoth. [1 mark]

Sample response	The response
Convergent evolution	• identifies convergent evolution [1 mark]

b) Use the principles of natural selection to explain the similarities between the two species. [2 marks]

Sample response	The response
As both species live in similar environments, they experience similar selection pressures, so natural selection will favour similar features. In this example, a longer beak/proboscis increases the chance of accessing food, and therefore survival, long enough to reproduce and pass on the trait. This results in the trait becoming more common in both populations over time.	<ul style="list-style-type: none"> <li>• recognises the two species are exposed to similar selection pressures [1 mark]</li> <li>• explains how natural selection favours similar features [1 mark]</li> </ul>

c) Explain how coevolution of the hummingbird hawkmoth and tube-shaped flowers may have occurred. [2 marks]

Sample response	The response
The hummingbird hawkmoth and tube-shaped flowers place selection pressures on each other, resulting in complementary characteristics (the proboscis length matches the flower depth). This gives the hawkmoth an advantage over species with shorter proboscises (access to food) and advantages the flower because the hawkmoth is more likely to distribute pollen to other flowers of the same species. Coevolution has most likely resulted in longer proboscises and deeper flowers.	<ul style="list-style-type: none"> <li>• explains that <ul style="list-style-type: none"> <li>– the two species impose selection pressures on each other [1 mark]</li> <li>– this results in complementary characteristics [1 mark]</li> </ul> </li> </ul>

<b>2023</b> <b>Paper 2</b> <b>Section 1</b> <b>Question 8</b>  <b>Continuity of life on Earth</b>	Explain how temporal isolation can lead to speciation. [3 marks]			
	<table border="1"> <thead> <tr> <th>Sample response</th> <th>The response</th> </tr> </thead> <tbody> <tr> <td>Temporal isolation occurs when populations differ in their periods of reproductive activity, so genes are no longer exchanged. Paper 2  
Section 1  
Question 11**

**Continuity  
of life on  
Earth**

Allele frequencies were monitored in two large populations of field mice from neighbouring forests over a 10-year period. Results are shown.

**Forest X**

Year	Genotype			Allele frequency	
	AA	Aa	aa	A	a
2013	52	146	102	0.42	0.58
2014	48	144	108	0.40	0.60
2015	55	147	98	0.43	0.57
2016	60	150	90	0.45	0.55
2017	58	142	100	0.43	0.57
2018	58	148	94	0.44	0.56
2019	59	152	89	0.45	0.55
2020	60	148	92	0.45	0.55
2021	65	149	86	0.46	0.54
2022	66	149	85	0.47	0.53

**Forest Y**

Year	Genotype			Allele frequency	
	AA	Aa	aa	A	a
2013	0	0	300	0.00	1.00
2014	0	0	300	0.00	1.00
2015	0	0	300	0.00	1.00
2016	0	15	285	0.03	0.98
2017	3	46	251	0.09	0.91
2018	14	60	226		
2019	31	91	178	0.26	0.75
2020	48	104	148	0.33	0.67
2021	60	122	118	0.40	0.60
2022	66	137	97	0.45	0.55

a) Calculate the allele frequencies for forest Y in 2018. Show your working. [2 marks]

Sample Response	The response
Frequency (a) = $[(2 \times 226) + 60] / 600$ = 0.85  Frequency (A) = $[(2 \times 14) + 60] / 600$ = 0.15	<ul style="list-style-type: none"> <li>• provides appropriate working [1 mark]</li> <li>• calculates the frequencies of both alleles [1 mark]</li> </ul>

	b) Identify temporal trends in allele frequency for forests X and Y and infer reasons for the observed differences. [6 marks]	
	<b>Sample Response</b>	<b>The response</b>
	<p>Allele frequencies remained relatively constant in forest X over the 10-year period, with a slight increase in allele A over time. This suggests genetic drift is occurring and the changes are likely due to chance rather than the environment favouring a particular phenotype.</p> <p>This contrasts with forest Y, where the frequency of allele A increases significantly over time after it first appears in 2016. The allele may have been introduced to forest Y due to migration (mice moving in from a neighbouring forest) or mutation. Either way, it is evident that the allele A provided a selective advantage to mice in forest Y, resulting in its frequency increasing over time.</p>	<ul style="list-style-type: none"> <li>• identifies allele frequencies remain relatively constant in forest X over time [1 mark]</li> <li>• infers a reason for the temporal change in forest X [1 mark]</li> <li>• identifies allele A first appeared in forest Y in 2016 [1 mark]</li> <li>• infers this is due to migration (gene flow) or mutation [1 mark]</li> <li>• identifies the frequency of allele A increases over time in forest Y [1 mark]</li> <li>• infers allele A provides a selective advantage to mice in forest Y [1 mark]</li> </ul>

<p><b>2021</b> <b>Paper 2</b> <b>Section 1</b> <b>Question 7</b></p> <p><b>Continuity of life on Earth</b></p>	<p>Koalas were once widespread in Australia. Due to a variety of factors, their population decreased and fragmented into small pockets, forcing them to inbreed. They have recently been hit by devastating epidemic diseases.</p> <p>Explain why koalas face an increased extinction risk from disease. [3 marks]</p>	
	<b>Sample Response</b>	<b>The response</b>
	<p>High genetic diversity may allow for some members of the population to survive diseases and later reproduce and pass on their resistance to increase the survivability of the population.</p> <p>However, inbreeding creates low genetic diversity, which makes koalas vulnerable to extinction due to disease.</p>	<ul style="list-style-type: none"> <li>• explains how genetic diversity can prevent extinction during rapid environmental change, e.g. disease [1 mark]</li> <li>• describes why koalas have low genetic diversity (inbreeding) [1 mark]</li> <li>• states that koalas are more vulnerable to extinction due to low genetic diversity [1 mark]</li> </ul>

<b>2021</b> <b>Paper 2</b> <b>Section 1</b> <b>Question 8</b>  <b>Continuity of life on Earth</b>	Australia has many bird species that have evolved to be largely dependent on mangroves.  These species are patchy in their distribution because of: <ul style="list-style-type: none"> <li>• the island-like distribution of their habitat</li> <li>• exclusion by possible competitors</li> <li>• geographical barriers.</li> </ul>			
	Identify and describe the mode of speciation that may have caused diversity in mangrove bird species. [3 marks]			
	<table border="1"> <thead> <tr> <th>Sample Response</th> <th>The response</th> </tr> </thead> <tbody> <tr> <td>           This is allopatric speciation, where populations of the same species are separated by barriers (island-like distribution, exclusion by competitors, geographical barriers) meaning that no exchange of genetic material is possible and gene flow is halted. Over many generations, mutation, natural selection and genetic drift result in genetic and phenotypic divergence until a new species is formed.         </td> <td> <ul style="list-style-type: none"> <li>• identifies the mode as allopatric speciation [1 mark]</li> <li>• describes two elements of allopatric speciation               <ul style="list-style-type: none"> <li>- cessation of gene flow due to a barrier between population groups [1 mark]</li> <li>- genetic drift over time until divergence [1 mark]</li> </ul> </li> </ul> </td> </tr> </tbody> </table>	Sample Response	The response	This is allopatric speciation, where populations of the same species are separated by barriers (island-like distribution, exclusion by competitors, geographical barriers) meaning that no exchange of genetic material is possible and gene flow is halted. Over many generations, mutation, natural selection and genetic drift result in genetic and phenotypic divergence until a new species is formed.
Sample Response	The response			
This is allopatric speciation, where populations of the same species are separated by barriers (island-like distribution, exclusion by competitors, geographical barriers) meaning that no exchange of genetic material is possible and gene flow is halted. Over many generations, mutation, natural selection and genetic drift result in genetic and phenotypic divergence until a new species is formed.	<ul style="list-style-type: none"> <li>• identifies the mode as allopatric speciation [1 mark]</li> <li>• describes two elements of allopatric speciation               <ul style="list-style-type: none"> <li>- cessation of gene flow due to a barrier between population groups [1 mark]</li> <li>- genetic drift over time until divergence [1 mark]</li> </ul> </li> </ul>			

<b>2021</b> <b>Paper 2</b> <b>Section 1</b> <b>Question 9</b>  <b>Continuity of life on Earth</b>	A computer simulation was used to observe genotypic changes in the gene pool of 20 randomly selected rabbits. The simulation was set with these parameters: <ul style="list-style-type: none"> <li>• each rabbit's coat colour was either black or white</li> <li>• black alleles were dominant; white alleles were recessive</li> <li>• the number of rabbits was constant in each generation and breeding was random throughout the population</li> <li>• an environmental factor was chosen in the simulation to provide selection pressure.</li> </ul>							
	The table shows the results of the simulation at the start and after 20 generations.							
	<table border="1"> <thead> <tr> <th>Initial population genotypes</th> <th>Population genotypes after 20 generations</th> </tr> </thead> <tbody> <tr> <td>BB BB BB BB BB BB</td> <td>BB BB</td> </tr> <tr> <td>Bb Bb Bb Bb Bb Bb Bb Bb Bb Bb</td> <td>Bb Bb Bb Bb Bb Bb Bb Bb</td> </tr> <tr> <td>bb bb bb bb</td> <td>bb bb bb bb bb bb bb bb bb bb</td> </tr> </tbody> </table>	Initial population genotypes	Population genotypes after 20 generations	BB BB BB BB BB BB	BB BB	Bb	Bb Bb Bb Bb Bb Bb Bb Bb	bb bb bb bb
Initial population genotypes	Population genotypes after 20 generations							
BB BB BB BB BB BB	BB BB							
Bb	Bb Bb Bb Bb Bb Bb Bb Bb							
bb bb bb bb	bb							

Contrast the initial allele frequency with the allele frequency after 20 generations to draw a conclusion about the effect of the selection pressure on the rabbit population.

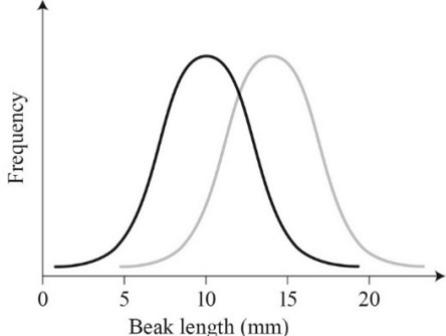

Sample Response	The response
Initial allelic frequencies were B 0.55 and b 0.45. Allelic frequencies after 20 generations were B 0.3 and b 0.7. B decreased (from 0.55 to 0.3) and b increased (from 0.45 to 0.7). This selection pressure was in favour of white rabbits as both genotype and allelic frequencies shifted toward the white phenotype and the white allele.	<ul style="list-style-type: none"> <li>• provides the correct initial and final allele frequencies [1 mark]</li> <li>• identifies consequentially correct change in allele frequency [1 mark]</li> <li>• states a consequentially valid conclusion [1 mark]</li> </ul>

<p><b>2020 Paper 2 Section 1 Question 9</b></p> <p><b>Continuity of life on Earth</b></p>	<p>Fossil evidence seems to show that the morphology of the Queensland lung fish has remained relatively unchanged for the past 100 million years.</p> <p>Describe the features of the theory of natural selection to explain how this may have occurred. b) On the graph provided, sketch a representation of directional selection for the beak length scenario. [1 mark]

Note: If you make a mistake on the graph, cancel it by ruling a single diagonal line through your work and use the additional graph on page 17 of this question and response book.

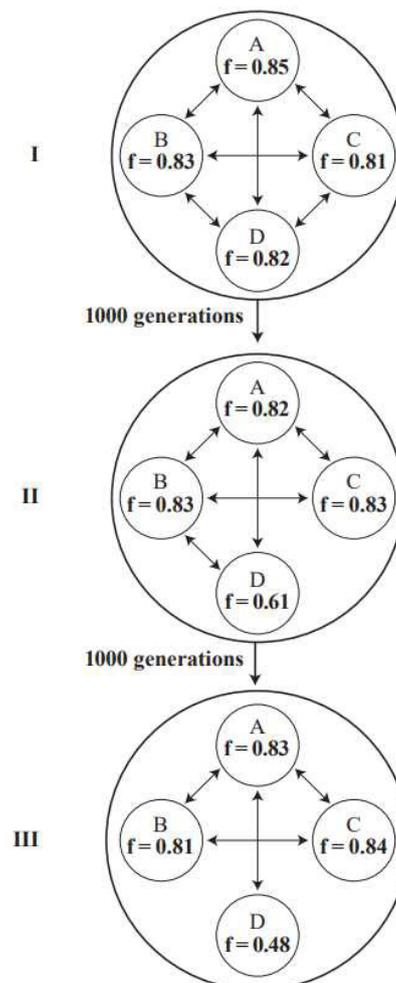

Sample Response	The response
	<ul style="list-style-type: none"> <li>• sketch indicates shift to longer beak length [1 mark]</li> </ul>

**2020  
Paper 2  
Section 1  
Question 11**

**Continuity of  
life on Earth**

The image shows changes in the frequency of a particular gene in a single species of bird, leading to a speciation event. These changes have occurred over a period of successive time points (i.e. I, II and III) each separated by approximately 1000 generations.

- The letters A, B, C and D represent separate niches inhabited by the birds.
- The arrows depict gene flow between the niches.
- The allelic frequency for the gene is shown as  $f$  in each niche.

Draw a conclusion about the type of speciation that has occurred in this population. Explain your reasoning by referring to the information provided in each of the time points. [6 marks]

Sample Response	The response	
<p>At time point I, there is equal gene flow and equal allelic frequency in all niches, indicating a high degree of interbreeding between all niches. Trends show that the niche labelled as D has a progressive decrease in allelic frequency of the gene from time point I to time point III. This is supported by gene flow halting between C and D at time point II and then further from B to D at time point III. Gene flow between niches A, B and C remains constant throughout all time points, as shown by the arrows and also by the constant allelic frequency. This evidence supports a potential speciation event at niche D. Niche D however is not totally isolated as there remains some gene flow to the other populations (through niche A). This excludes allopatric speciation as the mode of proposed speciation. There is however an element of population isolation through niches, which supports parapatric speciation over sympatric speciation.</p>	<ul style="list-style-type: none"> <li>• identifies 3 pieces of evidence of speciation</li> <li>• infers that speciation is not allopatric because D is not isolated, e.g. at III, there is still gene flow with niche A</li> <li>• concludes that parapatric speciation occurred at D</li> </ul>	6 marks
